I'm looking for ST software Notator or Encore preferrably, or any
otherscoring software you might have out there comparable to those.

HEY LOUIS

I got Atari Planetarium. It was a commercial program put out by
none other than Atari. It is an older program. However it works on
my TT! Low/med/hi St res. It allows you to scroll around the sky,
```

add the constellation lines or remove them. Pick your relitive viewing position on a world map. You can also save a screen as a degas file. very nice program.

HAPPY SPACE 1999!

| . . . .
|I'm not sure exactly what that means but I'm curious as to what people really
|want their computers to do??
| . . . .

Word processing mostly. I use Papyrus with a 21 inch high resolution mono screen which makes things a lot easier and a 600 dpi laser which gives me the required quality of output. Letters, reports, an index of a local journal etc. Currently scanning old (1850s) journals, extracting the text using OCR and preparing it for publication. Used to do posters for meetings.

Family history. No music (apart from audio CDs). Little in the way of graphics. Web, of course. Not many games run on this setup but I have a Mega ST for those. I used to do some programming but I worked on a bottom-up, trial and error basis and never got very far. Sending faxes using COMA. Some database work particularly a membership list for a local society which has its own Mega STe.

At work I have a Mega ST which is mostly used to talk to databases on other computers. Work is starting to move into the field of pure electronic processing of forms, letters etc and I have to get a peecee for this. I am keen to try voice-recognition software which also means not_Atari unfortunately.

The radio station I worked for in Israel had a very clever Anglophile
Israeli engineer/DJ, and in the early 80's he transmitted some binary code
over the 50Kw AM broadcast transmitter as part of a experiment. Not sure
what computer system they were using at the time, but the experiment was a
success - somewhere I have a bit more about this, somewhere!!!

Kind regards

Well,- I did try on our Radio/TV stations HP, DRTV and TV2.
They use this pnm protocol for real audio and for real vidio to,
but nothing shows up in CAB, except for a long line of text that
looks like the example you have.

I`m using CAB 2.7 and I-Conn.

cheers
and a happy new year

Out of interest Atari Computing magazine (printed version) has readers in
the following countries:

England
Scotland
Wales
N.Ireland
Eire (Republic of Ireland)
Germany
France
Spain
Portugal
Italy
Austria
Sweden
Norway
Finland
Netherlands
Belgium
Czech Republic
Slovakia
Croatia
Slovenia
USA
Canada
Australia
South Africa
New Zealand
Hong Kong
Malaysia
Poland
Switzerland
Luxembourg

IIRC I think we have a reader or two in Denmark who get their mags from an
agent in another country.

Pretty impressive list I reckon and just shows how far spread the Atari
community is!

BTW, issue 12 of Atari Computing is being worked upon right now - sub details available from addresses in my sig!

Local distributors/agents in Sweden, Norway, USA, Germany, Netherlands, Australia and New Zealand.

Happy New Year to all Atarians everywhere!

Kind regards

Mike Kerslake

Martin,

been thinking about Wdialog already. I took it from the set and now it's
OK. Some programs still have problems: QED will not set the parameters
right when starting up. E.g. for *.tmp files I set it to break lines at
inserting text at 75 chars (for Okami). When running N.AES, it won't do
that. Calling up the config box for "local parameters" in QED won't
display the ticked or not ticked stuff, just empty white boxes.Can't
really see when it's active or not. So I just click at random and it's OK
then. But when doing CTL-S and CTL-Q, to get back to Okami and then
reacting to another message, it comes back in with the settings wrong.
Now I'm gonna save them here and see what comes up next. And how it's
going then under MagiC. Weird, to say at least...

I'm gonna switch to email for some more questions on setting up Mintnet.
CU there,

items.
> I am based in Surrey. Most of the old Atari dealers I new have gone PC.

You will normally need a SCSI drive and a host adaptor such as the Link. It is possible to use IDE drives, but only with an STE so SCSI is really your only option AFAIK. Latest version of the Link (I think) is Link97 which will handle the latest drives. You will also need driver software for the HD, there are freeware drivers such as Atari's AHDI available from the main FTP sites - check Hallvard's pages for up to date list of sites:

http://www.geocities.com/SiliconValley/Bay/8745/

However, I'd recommend HDdriver, which is commercial but still being constantly updated to support just about everything new (including Zips etc). It costs around UKP30, IIRC.

For both a Link and HDdriver, contact System Solutions in Windsor/London.

You should be able to get contact information for SysSol from Hallvard's pages I think. If not, I can dig it out for you.

As for max size etc, I *think* it is dependent on your operating system and version. The main problem is that there is a limit to the size of a partition and there is a limit to the number of partitions you can have. Others around here have better knowledge of this so I'll leave the details to them. I would have thought that you'd have no probs up to a gig, though.

You might like to check out Nicolas Bales' quick FAQ too for more pointers. It's at:

http://quickfaq.atari.org

I wouldn't count myself as 'noone'. ;-)

>fVDI exists. It _is_ a VDI replacement for MiNT, which includes

fVDI currently has no special support for MiNT, but one of the reasons
for it is to have a VDI for the future replacement OS Fenix.
It does, however, work under MiNT as well as TOS and, hopefully, MagiC.

>a TrueType driver. Soon, it might also include PostScript type 1.

There is currently no TrueType driver included, even though I have
compiled and tested FreeType on my Falcon. A font rendering interface
is needed before this can be used together with fVDI.
Once such an interface is available, free source code for a PS type 1
engine could be used as well.

Unfortunately, I'm still the only one working on this (apart from some
help I've received with the mach64 driver), so there are other things
I must concentrate on first.

The latest beta version of fVDI was uploaded to my ftp site just before
Christmas (IIRC). IME, this one works rather well and the only really
major missing functionality (compared to the normal VDI) is text effects.
Text, mono-expand blits and patterned fills are still only black and
white (for 16 colour mode, the 16 bit driver does them in colour) and
some of the more exotic drawing primitives (pies and thick lines for
example) are missing.
For more information, take a look at the fVDI pages on my WWW site and/or
the various archives available via ftp from the same place:
http://rand.thn.htu.se ftp://rand.thn.htu.se

On a machine with fast local RAM and slow screen access (like my AB040
equipped Falcon), fVDI can do things like scrolling significantly faster
(50-100%) than NVDI.
Text drawing is only fully accelerated in monochrome mode (probably
faster than the standard VDI in other modes), but there it is really
fast. On my machine, the GEMBench 'small text' test is about _five_
times faster than with NVDI. Once I get off-screen bitmaps implemented
(halfway there) text will be drawn off-screen in monochrome and then
blitted to the screen, which will make it fast for all graphics modes.
The current mach64 (NOVA etc) driver is really fast at the things it

accelerates (lines, blits, fills and some text/icon widths (the mono-expand routine is not working 100%)). That accelerated driver is, however, not included in the current archives.

I had planned to do a new full release before the end of '98, but I've not yet got around to implementing (software) accelerated mouse cursor drawing and the unaccelerated version is unstable (character overruns due to missed interrupts (it takes a while to draw a cursor pixel by pixel)).

As always, any offers of help would be greatly appreciated.
If you don't want to work on the actual programming, perhaps you have some useful code or some time to test fVDI with various programs?

I use Geneva (without Mint) and have had the same problems. Could there be a problem in the way aFTP handles paths when run from a program in another directory? Anyway, it's something I'd very much like to see fixed, since I have yet to see an Atari FTP program successfully work 100% when used as a CAB plug-in.

I use a Canon BJC-4000 printer on my Falcon. Any of the BJC printers should work well with just about any software. All software that I've run into has either a driver for a compatible Canon BJ printer or an Epson LQ (which the Canon printers and I'm sure many others are compatible with). Yes, Imagecopy and Pagestream work well with this printer as well in color (although Pagestream's picture printing is VERY low quality for some reason - text and line printing is fine, though) and NVDI 4/5 should have an appropriate driver also (I am currently using SpeedoGDOS so I'm not sure yet about that). I'm sure many other printers are supported by most software as well. What I would suggest would be to figure out what software you'd like to use and ask what printer drivers it supports (or look it up if you already have the software) and purchase a printer based on your findings. Good Luck!

I use a 14Mb Falcon with a Nemesis accelerator and a 56K modem (now that zetnet finally support a sensible V90/56K set-up). Thanks to Roy Goring I had a very painless upgrade from using STING with my old 33K6 to the 56K, and my Web access is seriously fast now. If you leave the pics off it is even faster....Now I'm saving up for an Eclipse graphics card and a Tempest accelerator to go even faster...<More Steam IGOR ! :-))>

I think you'll find that if you use a Falcon and add a decently quick modem and Nemesis then you can fly along on the net....From experience I'm getting downloads as fast as with the ISDN line at work...

Hi Martin. I've got a real problem with Newsie and MIME files. UUencoded
files work fine, but if I tell Newsie to extract a MIME file, it does
one of too things, locks Newsie out so that I have to close all of my
windows, then restart it all, or causes a crash outright. Note that I'm
using Mint (of course!) but that its not specific to Mint because I had
the same problem with Neodesk/Geneva. Any ideas? ;-)

<> ~~
<>is what I have.
<>
<>I'm using a SupraExpress 28k8, so it's probably more or less the same
<>(check the manual tho').

Hi Misha,
Looking at the manual it gives the following valid lines :-

AT DT 555-5055 [CR]
ATH [CR]
AT &F &C1 &D2 &W [CR]
A/

<>Err... you haven't tried STinG, then? Or at least there's a better
<>Dialer for STiK (at Peter Rottengatter's site?).

I have tried STinG but that didn't work either. I didn't know about
this better STiK dialler - must look at that. I guess I kinda like
STiK, always used it and its never given me any trouble that I know
about. So I suppose its a case of - better the devil you know, and if
it ain't broke, don't fix it.

<>Just a thought... Is the upgrade definitely for 38k4 ??? I'm just
<>wondering if it's worth trying 57k6 (or even 115k2) in DIAL.SCR (but
<>don't get too hopeful).

It was for 38k4. I've just tried 57k6 in DIAL.SCR and that didn't
work. I received today a more comprehensive upgrade circuit that has
a 3 position switch giving a choice of 19k2, 38k4 and 57k6. So one
final check with the magnifying glass and if that fails, I'll be off

to Maplins for some parts.

Cheers
Mike

Ronald,

have the very same version here. What's the situation: I set up QED from under MagiC, and that's where *.tmp files were defined NOT to break lines on existing text, but DO break lines at inserting text. It does just that. Not so when running Mint/N.AES.... can U explain? So I set it again under this OS, saved and it was OK. Next I go back running from MagiC again and call QED and U guess: not OK any longer. Settings have changed again...

What's this? Some devil watching U running two competitors and screwing up things?
What at least I don't like is when putting something different from 8x16 fonts into the system under Mint/N.AES, several programs have problems in displaying things (like QED). Some others don't. Preliminary conclusion is that MagiC does a much better job here. Have found NO app at all going bezerk on using a weird font in the AES under MagiC. But N.AES makes it a mess, I'm sorry to say.
Also Freedom behaves weird: I cannot call it as Fsel, only as CPX-manager. Under MagiC no problem... And before someone jumps in, "Freedom is OK": yes, it's OK. Calling it from the menubar is what goes wrong here. Normally you should be able to call it as fsel by hitting shift while selecting the Freedom item. Not under N.AES...

And before I'm off again, tell U another weirdo: my window CPX was set for a certain display on "active" window and another one for "not active". Also saved while running MagiC. Well, U guessed right, that goes strange again operating N.AES: one gadget displays completely different. And again, when correcting it and saving the config, next returning to MagiC and this one gadgets displays different from the others again... To make

it worse, the specific gadget was the "move to background one" and
displayed just as one white box. So it immediately attracted my attention.

You explain to me please... ???

Looks like even the AES-es from MagiC and N.AES are not compatible :-(

Funny, if for some reason Okami refuse to undecode a message I use
munpack.ttp as stand alone prg to decode the message. Munpack is certainly
not the culprit.
He I just tested Newsie 0.92. I could unpacked a mime decode message
without any hasle.
Are you sure your settings are right? BTW: I slightly recall me I had
similar problems in the past
You may try to save the message (I guess this is possible with Newsie) and
then pass the message to munpack.ttp. It should work

yes, that's called your HOME. QED saves in $HOME.
Now, calling this feature a bug is up to you.

All magic users, do you recognize yourself into Louis? or is he a special
kind of magic user?
Coz if everything he says, thinks, you think the same, This will make my
future decisions about portability a little bit easier.

>

> bezerk on using a weird font in the AES under MagiC. But N.AES makes it a
> mess, I'm sorry to say.
Sorry to say? maybe first read 1 doc saying that non-prop fonts in AES
will most likely look weird.

> Also Freedom behaves weird: I cannot call it as Fsel, only as CPX-manager.
> Under MagiC no problem... And before someone jumps in, "Freedom is OK":
Freedom works perfect in Naes, only prob is that after a certain of
utilisations/calls, it will unload itself.

From what I heard, the author knows about that, max number of application?
Don't remember the bug in freedom, and rewriting Freedom Might not be
worth it. Don't know about that, Better ask the author. Apparently the
prob appears because Naes doesn't have any limit of GEM app running at
same time, nor, max num of opened windows and such. So freedom gets messed
up somewhere.. (not expecting this). (from what I heard).

> You explain to me please... ???
>

> Looks like even the AES-es from MagiC and N.AES are not compatible :-(

hm I thought we were all pretty clear, Magic and N.aes/multitos/geneva/
Aes 4.1 etc are NOT compatible, and the AES that is the most uncompatible
is Magic AES. Some may like it, fine, perfectly fine.. At least some atari
users...
But I can tell you this:
Teaching you everything there is to know about a different environment
other than magic just for the fun of it, is just NOT fun, especially when
you just want to prove one point, That magic is easier, and faster and
better. Well, so far you've only proved that you can't read docs, that
you can't apply common sense to everyday situations, and make Magic users
look more stupid than what they are. (J.reschke, D.Ackerman, Perot, etc
etc all use magic, so, I am NOT saying that magic users are dumb, coz
those names prove the opposite, but at least they know why they use it,
not just because the proportional font used in the AES looked better than
any other AES.)

Can tell you another thing, Magic being so great, giving you everything
you want/need. I can bet you 300 bucks that you gonna be a win95/98 user
before me (if ever). Why? coz there is something lacking, that you don't
know yet maybe.
Meanwhile, you are still struggling with simple things.

PS: what do people do when using prog that were made for magic? like using
the magic shared lib. They either don't use the program, or call that a
buggy program coz it ain't working on their setup, or just end up buying
magic.

Once again, This is not a FREE flame/war/advocate thing, This is a
very important matter to me.

Thanks for reading.

```
The only directly pluggable option is an old Atari HD. Both IDE or SCSI
require an adapter, but there are no IDE adapters for the STF available
nowadays, unless you're willing to build it yourself. If it's an STE, then
you can get an internal IDE adapter for a 2.5" HD. SCSI requires a SCSI host
adapter.

This is all detailed in the Quick FAQ.

I can't give you an answer to your question. Just want to say that I don't
have any problem to use Cab and aFTP together.
I usualy use the MiNT version of aFTP but as an test I also used for a
while the STing version. No prob whatsoever.

Can it be that MagiC has something to do with it? A while ago there was
the same question on the French Atari newsgroup. Some people with Magic
couldn't use aFTP from within Cab.

MB>
MB> Does that come on the line :- PREFIX=ATDT or INIT=ATZ ? I'm using a
MB> Suprafax 28.8 Modem.

Well, I _thought_ I had it in the PREFIX, but it's not, innit <G>:

INIT = AT&F2L3W2S11=50
~~
is what I have.

I'm using a SupraExpress 28k8, so it's probably more or less the same
(check the manual tho').

MB> Well I tried it without this last edit, and I seem to be getting the
MB> same results. The modem dials out and gets through to Zetnet but the
MB> telephone no. stays in the STIK dialogue box and thats quickly
MB> followed by three bombs.

Err... you haven't tried STinG, then? Or at least there's a better
Dialer for STiK (at Peter Rottengatter's site?).

MB> On switching back to 19200 I found I only needed to replace the Baud
MB> rate in DIAL.SCR to 19200 and it works fine with the revised
MB> settings in HSMODEM.

Just a thought... Is the upgrade definitely for 38k4 ??? I'm just
wondering if it's worth trying 57k6 (or even 115k2) in DIAL.SCR (but
don't get too hopeful).

MB> I guess I'll have to carry out further checks on the upgrade.

Good luck.

MB> <>Happy New Year,
MB> <>Misha
MB>

Do you mean differences between a Falcon and other Atari computers, or
between various versions of the Falcon ?

I'd have a look at the DOITF030 archive, quite a large thing to download,
but well worth it for all the hardware information it contains.

I will stick my toe into this tepid water just a bit.
MiNT is not easy to configure, and you do have to read the
documentation. It does however perform all my necessary task with the
utmost compatibility. Why anyone would argue that because Freedom has
problems under MiNT and N.AES is beyond me. Why not just use a
different file selector. Personally, I found Freedom to be a pain in
the ass, especailly the last release. Not something I want to waste my
time on. MiNT on the other hand brings me a little closer systems
used at my work enviroment. I can at least have a meaningful
conversation with my network manager and he fully understands what I
am talking about, which is especially nice considering the many ports
from BSD to MiNT. I don't even have to ask questions here, I can just
go to him for the aid. I think too that learning how MiNT and it's
associated files work together on different hardware will prepare me
for the ultamate purchase, and 060 TOS clone. Something I image that
MagiC users will have problems dealing with......

Anyway, if it don't run under MiNT and N.AES, shit can it!

Mike

52. NEWSie quirk

> kind of magic user?

I think in this case Louis has a point. And it's *not* a MagiC vs MiNT
thing at all, per se. For people who are coming from a background of using
vanilla TOS, storing configs in a home directory is NOT remotely intuitive
(the concept of a home directory is itself not intuitive in a TOS context).
So when you switch to an OS where the environment variable is set and
programs unexpectedly start using it confusion reigns. This really only
started with MiNT, but (ironically in the circs) MagiC is becoming more
MiNTy in this respect, hence the stuff in that other thread recently. If
you are using MagiC up to v5 then the variable isn't set by default, so
your system behaves in a very TOS-like manner with your configs where you
expect them. Apparently from v6 MagiC installs with the home variable set,
though stupidly not checking that the directory exists, which is brain-dead
IMHO (apologies to MagiC author if this isn't the case).

As to whether storing all your configs in one directory is a good thing or
not is a matter of taste and circumstances. Practically essential in a
multi-user environment a la Unix (which is where it's come from, no?).
Largely pointless on a single-user machine, though very common none the
less. Personally one of the things about Ataris I've always liked is that
generally programs keep all their bits in their own folders so you know
where to look for them. You don't have to worry about orphaned bits if you
delete them, or have to use dodgy uninstall programs to clean up the mess
(one of the things I *really* don't like about Windoze). Other people's
mileage may (and probably does) vary.

> Meanwhile, you are still struggling with simple things.

Simple if you are a Unix-head, not if you are used to TOS. Please note here that I am NOT anti-MiNT or anti-Unix (in fact I'm contemplating using MiNT to learn more, and possibly installing Linux on this PC), but IMHO Unix stuff is largely foreign territory for people coming from a vanilla TOS background, hence confusing.

> Once again, This is not a FREE flame/war/advocate thing, This is a
> very important matter to me.

NB I'm not flaming anyone here, just pointing out that if MiNT is Now TOS (and MagiC is getting MiNTy), it doesn't mean that TOS is Now Unix, so it's absurd to think that TOS users are even going to *think* about Unix stuff as the potential cause of a problem. It's reasonable to assume your TOS programs are going to behave the same way as under TOS, and when they start doing weird things get frustrated and confused.

OTOH it's logical to assume that ported Unix stuff is going to behave in a Unix-like manner, so no surprise when it wants a foreign (as in foreign to TOS) directory structure, obscure file system and environment variables, and stuff like executable flags setting rather than just calling executables .PRG .TOS or .APP.

Boils down to whether you are installing MiNT/N.AES or MagiC to run your Atari software in a multitasking environment, as a grown-up TOS (which is a perfectly valid thing to do), or whether you really want a Unix system that still runs your old software when necessary (which is also perfectly valid). Problem only occurs when the two goals clash, ie when your TOS software starts behaving "oddly" due to the Unixy bits.

This has more to do with application programmers than with either MiNT or MagiC, I guess. Perhaps having Unix-awareness switchable would be a good option so the program would behave normally unless told to become Unixy.

TTFN

I picked up a copy of GEM-GS off the net and haven't been able to get it to run on any of my machines (TOS4.04 Falcons with and without Nemesis, 4Mb TOS2.06 STe, PC using GEMULATOR)...any hints and tips? I get messages like <Can't run something.GTP>, etc even though I've scattered copies of it round the directories hoping to find the right one. I'd dearly love to get this running on my Nemsised Falcon as I have loads of PDF's of circuit designs and schematics that I could usefully have access to while I'm doing circuit designs...

>Sorry to say? maybe first read 1 doc saying that non-prop fonts in AES
>will most likely look weird.

Katherine,

before all this goes on and on and on, I'd like to explain:

First: I'm a U-S-E-R. Been running from different TOS-es for years, next switching to MagiC. I say: stable OS, provided you skip apps that don't like it (mostly old/very old ones). My experience: solid. Compared to MagiC, TOS is flakey all the time.
So, there's all these people yelling about Mint/N.AES. Give it a try then, OK? Well, in fact setting up Mint isn't that much work. Put mintnp in the auto, create a Multitos dir, give it a mint.cnf and install N.AES and adjust the config. Re-adjust where necessary.

Adding the minix stuff is different. Why did people bother to create the KGMD distribution? To make it a b-i-t more simple. To explain things.

You talk about reading docs. Well, fine, try to sort out the pile of docs on Mint/minix and all the relevant apps. Even the KGMD and KEMD texts have discrepancies... like in one it states "copy sockdev.xdd, slip.xif, minix.xfs from here to there". In the other one you see most of the same stuff, except for the small line somewhere "copy init.prg to /multitos". Aw, hell, good to have read it...

Another line from the files:
"... in case your ISP uses other values than 1500 for MTU and MRU, add
the lines
MTU whatever
MRU whatever
to the .ppprc file"
Since my ISP is on 576, I did just that.

Next call pppd and it complains about wrong parameters.
So I changed the added lines into
mtu 576
mru 576
and it did the trick.

Editting files you need an editor. VI comes with it. The textfile sez,
"Yes folks, it's a tricky one".
Thanks for that info.
Calling up VI, there's no way in getting it to edit, unless you start
hitting about just any key at random, then finally when (by sheer luck)
you managed to do so, next Q is: how to save the bloody file? No way...
Then don't save and quit. HOW???????? I did by CTL-ALT-DEL...
Yeah, read the docs! What docs? They just have been unpacked to the minix
Sir, but you don't know where to find them...
So, I found them later, and saw CTL-Z (twice) is for "save&exit".
Right, go into it again and try to edit the file. NOW I know you need to
get it into "input mode" first, then edit the text, next get it to
"command mode" then enter CTL-Z (twice), but on the first combo it
displays "CTL-Z not supported in sh shell".... Nice going!

Ok, so much for all of it, but meanwhile I managed to get Pico going.

Talking about N.AES then:
From the "features list": "you can change your systemfont to whatever you
like; non prop, prop, whatever".
Since I did so y-e-a-r-s ago from TOS, running just any GDOS program plus
Vdifont.prg I could put any non-prop font into the AES, and I've had no
app at all, not even the oldest ATari app I had, running into trouble.
Sometimes I got a mixture of the new font and the old sys font in
alertboxes, but I never lost characters.
Same from MagiC: no problem at all! Did just a splendid job here.

So I set N.AES to run this same font (9x14 NON-prop type) in the AES.
Guess what: 50 percent of the running apps have problems.
Someone here suggests it's QED running in truecolor...? Well, not so under
MagiC! And it's QED 4.51 indeed, since I never bothered getting 4.50
because of the bugs.

>But I can tell you this:
>Teaching you everything there is to know about a different environment
>other than magic just for the fun of it, is just NOT fun, especially when
>you just want to prove one point, That magic is easier, and faster and
>better. Well, so far you've only proved that you can't read docs, that
>you can't apply common sense to everyday situations, and make Magic users

>look more stupid than what they are. (J.reschke, D.Ackerman, Perot, etc
>etc all use magic, so, I am NOT saying that magic users are dumb, coz
>those names prove the opposite, but at least they know why they use it,
>not just because the proportional font used in the AES looked better than
>any other AES.)

I think you're just missing THE whole point here: I'm not trying to prove MagiC is better. I'm trying to find out whether or not this Mint/N.AES is worth the trouble. I think it is, but at the same time I'm experiencing some strange behaviour and reporting it. Well, if you call that "proving MagiC is better", that's just your interpretation.
>
>Can tell you another thing, Magic being so great, giving you everything
>you want/need. I can bet you 300 bucks that you gonna be a win95/98 user
>before me (if ever). Why? coz there is something lacking, that you don't
>know yet maybe.
>Meanwhile, you are still struggling with simple things.

READ this again please Katherine, and start laughing yourself...!

>Once again, This is not a FREE flame/war/advocate thing, This is a
>very important matter to me.
>
>Thanks for reading.
>
Same here. As a user I depend on the OS. Be that TOS, MagiC or whatever. TOS is out for me. Too instable, getting too many problems time and time again. Some years ago I switched to MagiC. I like it. Solid. Period. Maybe not on a Falcon... haven't got one. On this TT it's reliable.

But I'm open to try others. Spend time/money/trouble on it. At the same time telling others about the problems I'm encountering (there's probably more people interested in it). Well, maybe had I come from TOS I wouldn't have encountered some of these problems. The situation is that I do come from MagiC, and therefore I DO compare. Not to downgrade Mint/N.AES, just to state the situation. I think that's honest.

I do appreciate your help. Thank you very much.
I don't appreciate however these kind of attacks you're launching. Thank you very much too!

Have a nice '99 anyway.

Well, thats what I've been doing. Saving the message out, then using
ESS-Code to unencode it. This works okay. Its just a tad bit annoying
since UUencoded files work so well with Newsie. ;-(

What settings? ;-)

Thanks! (remember I had this same exact problem with Neodesk/Geneva but
not with SingleTOS)

Hi Chris. SFT is Systems For Tomorrow, a fine place for any Atarian to
turn to when in need. They are located in the United States, not sure
where you are? ;-)

Anyways, here is some pertinent info:

Systems For Tomorrow
P.O. Box 3034
Independence, MO (USA) 64055
Home phone: 800-875-4943
Work phone: 816-833-4738
Fax line: 816-252-3611
E-mail: sales@systemsfortomorrow.com
URL: http://www.systemsfortomorrow.com
Hours: Tues-Fri 12pm till 6pm (CST)
Saturday 10am till 6pm (CST)

Hope this helps! ;-)

62. [AD] SOFTJEE

Newsgroup: comp.sys.atari.st
Date: 1999-01-02 00:00:00 UTC
From: "J.E." <softjee@wanadoo.fr>
Message-ID: <368E300F.79000299@wanadoo.fr>
Source record: 87161

Hello to all !

Here is SOFTJEE from France...First, happy new year to all ! The new year start well for the Falcon users because we made reduction on Midplay and Audiomid. Now you can get Midplay at 190 FF (see your current seller) and Audiomid at 290 FF.

You can buy too our new software : DEvil Studio MIDI. This is a new sequencer Midi Cubase like but we new options and functions and more easy to use.

Here follow a software list you can find from your current seller.

** A.F.S.

A.F.S is a Audio File Selector allowing you to listen audiofile simplying by
clicking on it in the selector. A.F.S can play AIF/WAV/AVR file in D2D. Its
very simple file selector allow very quick using in accessory for Cubase for
example.

** Audiomid

Audiomid is an audio to midi translater. You can load audio sound (listen
it) and translate them into
Midifile. You can immediatly listen the Midifile (a midifile player is incorpored). The display allow you to see in same time audiofile and Midifile (in key edit mode).

Last revision is 1.01

** Easy Beat

Easy Beat allow you to compse easily audio rythms and record them in an audio file or midifile (and Digital Tracker song too...). Easy Beat manage 8
tracks and you can put for each tracks your own audio sound or audio sound
from audio banks like TR 808,...gived with the software.

Easy Beat is available in France and Germany. Ask to your current dealer to
have it !

** EXPAND

Expand is a Midi Sampler Software. You can load audio sound, make instruments multi-sample and play them with a Midi keyboard or a sequencer.
You can set too the ADSR for each sound, have graphic panoramic setting,...Expand understand the most of Midi messages like note-on, note-off, program change, main volume, pitch, fine,...

You can too put some digital effects on each channel like Reverb, Echo, Chorus,...

Last revision 1.04 with using in screen with 2 colors.

Revision 1.03 with the following function added :
Play AIF in D2D, load WAV, Selecting of External Clock, Frequencies of replay, set repeatt start/end of each sample, set polyphonic voice for each
Midi channel (select automatic for dynamic polyphonic voice or set the number of voice for each channel).

** MIDPLAY

Midplay is a Midifile player which play MID with audio sounds (so you can
hear Midifile only with Midplay and your Falcon). Midplay can play too KAR
file and displays the text of these files. Midplay use a GM kit audio to

play midifiles. You can mute each channel, have informations on it,...

Last revision is 1.06

** Pretty

Pretty is a Midifile Player BUT with MIDI OUT.(this is the difference with
Midplay). You can plays play list of Midile/Dir of Midiles. Pretty have too
severals options like "Record Module" which allow you to record in audio the
Midifile you're playing and "Grid edit Module" to display/change the Midifile.

Last revision is 1.01

** DIGITAL HOME STUDIO (D.H.S.)

D.H.S. is a very big soft allowing you to sample audio sound, sequence audio
sound in D2D or memory/ sequence Midi informations. D.H.S can load 256 samples and you can play them with any note you want. You can put them on
the sequencer or edit them in the sampler. You can apply digital effects in
real times or in the sampler. You can use in the sequencer Midi information/audio sound/Direct To disk sound in the same time. You have

too
some graphic function to set main volume of each track, effect level,...

D.H.S. manage 64 voices/ 32 tracks and play at 50 Khz 16 bits.

Now fully compatible with AfterBurner 040

Last revision is 1.07.

** DIGITAL TRACKER 1.9

The most popular/used soundtracker on Falcon. The new version of the
DIGITAL
TRACKER
is 1.9 better than the 1.2 distributed by Frontier Software.

Hi Ronald,

well, it doesn't matter. I've got overrun by one huge pile of docs already (Mint and all the related stuff), so a few more won't hurt.
Anyway, I'm dumb, as you've probably gathered by now, so I'm not getting anywhere anyway.

BTW, managed to connect from the console again to my ISP, get a link to ftp.funet.fi but next I'm stuck on how to get to the dirs... Well, I'm dumb. Buy a dozen books on Unix, I guess. When looking into the logfiles I discovered having received 5 emails from the Mintlist too. Can't get to them with Pine (yet; another thing to set up). No clue as how to read them using a different app. Well, they're fetched by Okami as well :-)

Ya know, this system here is probably too small to accomodate all these readme's, *.docs, *.hyps, *.mans and *.txts and whatever more I've seen. Need another 1 gig drive for those... :-)

For the moment I'm just glad Unix runs, connects etc. At the same time N.AES runs too... Next problem is setting up Mintnet. Martin explained some already. So I put gsresolv.prg, gluestik.prg and gluestik.xdd into my /multitos, changed Mint.cnf once more, created a c:/stik_cfg with a default.cfg in it but it's not working yet. Something like a dialer missing? Sting won't run with it. Well, I'm dumb, I should have known. Gimme a week or two, it may just get running :-)

Well, if there were no dumb people, this NG wouldn't exist, would it?

67. Final Judgement Day...

Newsgroup: comp.sys.atari.st
Date: 1999-01-02 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <368e60362bf6610@holleman.demon.nl>
Source record: 87166

Attention!!! (addressing The World here...)

Situation: Walter Cronkite - once more for a change - covers the live transmission by CBS/NBC/CNN and even the National Geographic Channel in "The Case MagiC vs. MiNT/N.AES"...
(There hasn't been that much coverage ever since Khruszhev smashed his shoe in the United Nations Assemblee and Neil Armstrong stepped onto the Moon.)

"All rise, Judge Lewey!"

J.L.: "MiNT/N.AES, thou areth condemned spending the rest of your lifetime labouring in the workforces of ASH! Case dismissed! BANG!!!! Next please...!
...aahh, Mr. Clinton, please be seated. Errmm, Miss Lewinsky, would you mind leaving the two of us alone, please?"

(end of live transmission)

PS: J.L.'s foreign bank acct #1234567890 at Swiss National Bank, Geneva.
(Euro currency preferred)

Ghostscript. Go to my web site for the English RSC files and readme, then follow the link to grab the binaries from Christian Felsch's site.

I found that the displayer section of GS thought that there were far fewer pages in a PDF doc than there really were (!) so I had to use the "Output" section to "print" the PDF doc to a PS file and read that instead.

Tho' for some reason this no linger works for me and the thing blows up after the first page has been written to disk :-(((

Message-ID: <01be364f$ae8f5d60$LocalHost@mad>
Source record: 87168

This is along the lines of a similar thing as what you asked, this is purely out of curiosity though.

Did Atari produce a manual specifically for the STe detailing the modifications that were made or did they just sling the STFM manual with it?

I was just wondering because my STe came with the STFM manual, but it was 2nd hand.

AM.

I think therefore I AM.

Does anyone have some cool Atari Falcon icons they could send me? I specifically would like one for card/solitaire games and one for mahjong type games...and anything else. Thanks. Oh one more thing, what is the best 16 color picture ,that uses the normal color scheme, that I could use for a backdrop wallpaper on my Falcon in 16-color mode?

>

Well,- AFAIR there is at least one in South Africa, can`t remember his name,
there is one in Singapore (William Wong), and there was, about a year ago, one user from
Brasil writing in this NG.
I think he was from Sao Poulo, and seems to know a fair deal about Atari,
and Amiga as well.

And there are some in Australia and New Zealand to.

And I do remember seeing someone from Chile, trying to sell his Atari stuff
in this NG, but that was a long time ago, maybe two years or more.

In the god old days of NeST and AtariNet the Atari users where spread all
over the world and there use to be +30 mess. in every conf. every day.

Getting a little nostalgic here,- :-))

cheers
and a happy new year

Hi! I just got an Epson photo 700. I'm getting it to work with anything that uses the drivers in NVDI 5, but am having no luck with the old Epson LQ drivers in Cuebase Audio or Calumus SL98. Anybody know of or have drivers for these programs that will work with the Photo 700? I don't really care about dpi beyond 360 for Cuebase (although that would be nice!), just something that will work! Any advice would be appreciated! Thanks!

Wayne,

If the program you are using has its own print drivers then you may be
out of luck. As the Epson 700 has a 6 ink cartridge system, I doubt that
any of the "normal" Epson drivers are going to work properly. With
regards to Calamus, there is a module available that will let you use
NVDI to print, by-passing the internal Calamus drivers. Check with
Invers Media (www.invers.de) for pricing and availability.

If you want I could send you the Epson Pro driver available for Calamus
so that you could play around with it.

I do. STinG and it's tools have been and are developed on an ST, for the ST.
That's probably one of the reasons it's so fast compared with other networking
stacks. I do not have any TTs or Falcons.

Why not ?

Well, you're probably right, if there is for instance some CPU intense stuff to
do suitable for a Falcons DSP, why not use it. BUT, what you say here has far to
often been used as a lame excuse to abandon ST compatibility just to save the
little work of thinking about the issues of compatibility.

Programmers are lazy, and especially hobby programmers are to often careless
regarding what their stuff does on other machines, other OSs.

Well what it takes is, 1 hour download if you don't have kgmd on cdrom.
2) printout the doc, depending the speed of your printer, 10 min.
3) read it then reading it again as you doing it along, 20 min.

Now, if you waste 3 weeks to set that up. Obviously there is a problem.

I've been wanting to do this on my TT, but I only have

94. Wanted: PC kbd driver

Newsgroup: comp.sys.atari.st
Date: 1999-01-02 00:00:00 UTC
From: Jan.De.Smedt@village.uunet.be
Message-ID: <76nj9r$5ja$4@xenon.inbe.net>
Source record: 87193

Hello everyone,

I connected a Trust W95 kbd to my Desktopper Falcon.

The connection is made with a print called Adaptakey,
http://wwwusers.imaginet.fr/~oxo/systems

I use the Adaptakey driver in the AUTO folder like they say, but
for the kbd to work I also have to use Pascal Fellerichos CKBD Deluxe
with the French kbd table. That way it works in TOS, Magic and N_AES.

My problem:
The Adaptakey driver dates from 1994 and so does CKBD.
It is a AZERTY kbd so I use F.KBD.
The top row keys (with the numbers) have two symbols in the lowercase
position and the keys next to "P" and "M" do not print the right keys.

- How do I get ASCII 045 "-" and ASCII 095 "_" to work properly?
They are next to the BACKSPACE but all I get is "=+" in TOS.

- What about the following characters?
[] are lowercase right next to the "P"
{} under the "9" and "0"
and \ are unreachable (lowercase right "3" and ">")

Does anyone have a correct CKBD *.KBD file so I can get to the keys?
Especially BACKSLASH is important for pathnames etc.

Greetings,
Jan

95. Falcon modem2 problem

Newsgroup: comp.sys.atari.st
Date: 1999-01-02 00:00:00 UTC
From: Jan.De.Smedt@village.uunet.be
Message-ID: <76nj9v$5ja$5@xenon.inbe.net>
Source record: 87194

Hi,

I`ve got a Falcon 030 with Mighty Sonic accellerator and 16 MB RAM + 4 MB TT RAM.
I`ve also got a 3com PalmIII. Communication between them is handlded through
the PilotLink by Rodolphe Pineau, a freeware MiNT/Linux port.

http://www.chez.com/stratos/pilot.htm

For speed I use N_AES 2.1 #970302 which I bought on the Neuss Atari Messe.

Just a few days ago the PalmIII refuses to link with the Falcon.
It did OK for months both under MiNT + AES 4.1 & MiNT + NAES.

I verified with Profile2 system analyser: de default com is now modem1,
it used to be modem2, as it should be. Even if I use SET_DEV7.PRG, wich is
supplied with Profile2 it still stays at modem1.

However, communication with my modem still is fine, faxing & internetting OK.

MODEM.CPX has the out port on modem1 and greyed out (disabled).

auto folder:
DRVIN .PRG 3.923 bytes 17.05.94 (HSmodem07)
SCC .PRG 8.756 bytes 08.06.96
MINTNP.PRG 191.097 butes 25.11.98 (FreeMiNT 030 1.15.1-0.3)
work fine

N_AES.CFG
.
export PILOTMODEL=PalmIII
export PILOTPORT=/dev/modem2
export PILOTRATE=38400
export PILOTBACKUPPATH=L:\PalmPilot\Backup
.

Could This be a hardware failure?
Can anybody help me please?
If anyone is interested in digging into this, please e-mail me and I will
attach a profile2 report and N_AES.CFG to the reply for analysis.
I haven`t done it now so as not to slow internet down (aprox 85 kB).

Merry Xmas and a happy New Year!

Greetings,
Jan

Normally Newsie does find the right utility. I just tested this for
another guy. Place the two prog's into a dir called 'work' inside the
Newsie dir. Go to 'path options' and set the working path to the work dir.
This should work I guess. Not sure as I'm not used to work with Newsie.

At that time I was using a 28.8 modem. I've used this modem just until a

As usually I don't have this. So beats me. Which version of Qed
are you using? I'm using the latest one. I know that version 4.50
for instance had some serious bugs. On my Hades it was unusable.
Too much trouble.

Calling up the config box for "local parameters" in QED won't
>display the ticked or not ticked stuff, just empty white boxes.Can't
>really see when it's active or not.

Strange indeed. It's however certainly not related to N.AES.

Selectric works oke indeed but as it doesn't show long file names I prefer
Freedom. Boxkite works also. Even UIS III works alright.

I have an Epsom Stylus pro working just fine with NVDI 4 and a Falcon.
Prints at 720dpi without problem - if a bit slowly. Expect to wait 15
minutes for a true colour page at this rez. Fast enough in B&W though.
```

I have made a list of all the things I have in boxes from earlier upgrades and looking to trade them for something I might like or could find useful.

Cases:
External scsi 1 case - plastic w/ power supply ($10)
Dual under monitor Scsi case - Metal, Scsi 1 & 2 cables w/ power supply ($40)

Cables:
Too many to list here (I have a huge assortment of cables, please email me if
you are looking for a certain type.)

Drives:
Quantum 250mb scsi HDD (apple) - 3 1/2 ($30)
Teac 1.44 floppy drive FD235HF ($15)
Seagate ST-225 MFM 20mb HDD - 5 1/4 ($10)
HP C1534 2gig scsi DAT tape backup ($150)
Quantum 230mb scsi HDD (apple) - 3 1/2 ($25)
Quantum 2110s fireball 2gig scsi HDD - 3 1/2 ($85)
Creative Labs Mitsubi 1x cd rom - uses Caddy (included) (make offer)
Western Digital 210meg IDE HDD - 3 1/2 ($20)
(3 each)Seagate ST9385AG 420mb IDE HDD- 2 1/2 laptop drive ($45)
Conner CFL350A 350mb IDE HDD- 2 1/2 laptop drive ($35)

Modems:
Practical Peripheral PM288MT II v.34 - external 28.8 modem ($25)
US Robotics 14.4 fax/modem internal - ISA ($15)
Intel fax/modem 14.4 - Pcmcia (missing adapter cable) ($5)
(2 each) US robotics 33.6 fax/modem internal - ISA (PNP) ($25)

Network:
Xircom PE3-10BC - Par port ether adapter ($20)
(2 each) Intel Ether 16 card - ISA (PNP) ($20)
IBM token ring card Turbo 16/4 - ISA (PNP) ($15)
SMC 16 bit ether card TP - ISA ($10)

Mother boards:
486dx2/66 VLB MB w/ 256k cache - includes processor and 16meg of ram ($55)
Pent 100 PCI MB w/256k cache - includes processor and 32meg of ram ($75)
486sx/25 ISA MB w/128k cache - includes processor and overdrive socket ($25)
486dx4/120 VLB MB w/256k cache - includes processor and 16meg of ram

($60)
(2 each)IBM Opal 486slc/33 ISA MB w/?cache - w/processor and
co-processor socket ($15)
ALI 386dx/40 ISA MB - Includes processor ($10)
Haedland 286/16 ISA MB - includes processor ($5)

Input devices:
Touche mouse pad - ps/2 style with drivers (PNP) ($20)
(3 each) MS mouse ver2 - ps/2 (PNP) ($15)
(2 each) MS mouse ver2 - serial (PNP) ($15)
HP mouse - ps/2 (PNP) ($10)
Gravis Phoenix 1010-1 Flight & Weapons controller system ($60)

Video Cards:
Oak Technologies 512k svga card - ISA ($5)
Cirrus Logic 512k svga card - ISA ($5)
S3 2mb svga card - VLB ($20)
Cobra Elite AT with spectrum upgrade (CAD card) - ISA (make offer)

Sound Cards:
Media Visions Pro audio 16 PAS16sl - ISA ($10)
(5 each) Aztec 16 bit sound card, SB compatible, w/ headphones - ISA
(PNP) ($20)

Cards:
Micro speed bus card - for bus mouse and trakballs - ISA ($15)
IK 2nd&3rd Par port card - ISA ($20)
IK 3rd&4th HS serial card - ISA ($20)
(4 each) KW Multi I/O 16bit cards - ISA ($8)
Promise IDE & Floppy Cache controller w/4 of ram (uses simms) - VLB
($25)
IK Multi I/O controller card - VLB ($15)

Scsi Cards:
Adaptec AHA-2940 scsi 2 controller - PCI (PNP) ($70)
Ultrastor U14f Scsi 2 Cache controller - ISA ($35)
Adaptec AVA-2902I scsi 2 internal only controller - PCI (PNP) ($50)
16 bit scsi card external only - ISA (PNP) ($20)

Memory:
(25 each) 256k memory chips 16pin dip (make offer)
(11 each) 1meg 30pin simms (make offer)
(8 each) 256k 30pin simms (make offer)

Switch Boxes:
Black Box A/B Switch Box - 25db female ($5)
HD15 AB switchbox 2 position - for VGA/SVGA monitors ($10)

Keyboards:
Gateway 102 key - ps/2 style ($20)
HP 102 key - ps/2 style ($20)
Gateway 2000 programmable keyboard with drivers - ps/2 style ($15)

Other:
Intel netport express xl print server 2 par & 1 serial ($50)
Targus notepac laptop case Model# CN01 ($20)
(3 each) Windows95 full OEM version CD's w/ manuals (sealed) ($30)
(4 each) Windows98 full OEM version CD's w/ manuals (sealed) ($45)
(9 each) Microsoft Home Essentials Software Bundle (sealed) - includes
MS money,
Encarta 98, Word 97 and Hallmark greetingcard software ($35)

Viking DLE-200a ring down unit (make offer)

P R I N T E R S
Apple laserwriter IINT w extra paper tray & 4 toner carts, has serial
& appletalk
interface. Unit has been reconditioned and motor has very low usage
($125)

A p p l e S t u f f

Keyboards:
Apple extended keyboard II - ADB (older version before the cheap ones
came out) ($25)

Input devices:
Kensington MAC trackball turbo mouse - ADB ($15)

A t a r i 8 b i t

Signalman 300 baud modem for Atari 8bit - for collectors ($10)

T h i n g s I w o u l d l i k e

PDA's of any brand, Atari Jaguar stuff, Atari Portfolio stuff, Atari
ST hardware & accessories,
Sega game console stuff (sms & Genesis), Gameboy stuff, camera
equipment 35mm,
Amiga Hardware.
Let me know what you would like to trade.... I may want it.

If you want to do cash then email me and we will work things out for
shipping,
Average price for shipping is $5 to $7.

James
My email is vf1s05@earthlink.net

You're using true color and Qed 4.51 isn't it. This version of Qed has
probs to display his dialogboxes. Get Qed 4.52 and your probs, at least
the dialogbox probs, will be solved.

104. [Ann]: Login v0.14 Beta

Newsgroup: comp.sys.atari.st
Date: 1999-01-02 00:00:00 UTC
From: quantum@voicenet.com
Message-ID: <kwgj2.1250$7P2.11727536@news2.voicenet.com>
Source record: 87240

Here's another version with some new features. If anybody is interested in finding out exactly what the program does in detail, I put the READ_ME.TXT file on the 'Net too. It's located at the same site as the program:

http://www.voicenet.com/~quantum/read_me.txt
http://www.voicenet.com/~quantum/login.zip

Eventually I'll write a nice happy web page for it. Again, any feedback, plz feel free to let me know! My address is quantum@voicnet.com.

Here's a snippet from the History file:

======
History

December 30, 1998: Version 0.13 Beta
o Added LOGOFF.PRG. Allows you to Update the current user's configs (found in 'C:\CONFIGS\USER.BIN'), or 'Shutdown' the computer for another person to logon after rebooting. Basically, shutdown does nothing except lock up the computer to make it look like it's been shutdown.

January 1, 1999: Version 0.14 Beta
o Happy New Year 1999!! Added LOG.TXT file to monitor who logs in and when. Shows bad passwords, bad usernames, attempts to erase or update other users via SETUP.TOS, logouts and updates via LOGOFF.PRG. Log file is a simple text file located at 'C:\CONFIGS\LOG.TXT'. As always, advice for improvement is welcomed!

There are so many different personality types that react differently to the same thing. These two responses are basically the same, but coming from different mentalities.

There is contructive criticizm, and destructive criticizm, and there are those that cannot tell the difference, in both posting and reading. The moral of the story is:

Relax.

>
>I have not written an ATARI ST program since:(.. well not for public

>
>Jeff
>
Dude, TOS is inside *every* ST. It might be TOS 1.0 compared to
another's TOS 4.0, but they all have TOS and GEM. My ST runs a TOS
bbs program full time. There are many programs that run on ALL STs,
TTs, Falcons, and anything else that you might not think is an ST.
There may be 5 or more TOS versions in a variety of STs with a variety
of GEM versions, that doesn't mean we should have a different
newsgroup for each TOS version. How about a:

comp.sys.atari.st.for.jeff.jewell :)

I have found this group to be very helpfull in answering any ST
questions I have - and I have a lot of them.

From: ad329@james.hwcn.org
Message-ID: <76oun6$frt@james.hwcn.org>
Source record: 86995

I have a Mega 2 ST sans keyboard yet I have a spare keyboard that was removed
from a dead 1040ST. What are the pinouts of the Mega St Keyboard Port and
how do they correspont to the connector on the 1040ST keyboard?

And any suggestions on building a case for the 1040ST keyboard once I've
got it hooked up to the beastie?

Also, is the Mega ST robust enough to put a monitor right ontop of it?

CRACKERS

Wow. I was taking another look at Atari Planetarium today and the whole thing
is on a single sided disk! I can't believe they cramed that much stuff on
a single sided floppy. I bet this means the program will even run on a
520ST.

Neat! Now I won't have to take a 1040 to my folks place.

CRACKERS

111. Oh no! JUICED CSB/DM!

Newsgroup: comp.sys.atari.st
Date: 1999-01-03 00:00:00 UTC
From: ad329@james.hwcn.org
Message-ID: <76oun7$fs3@james.hwcn.org>
Source record: 86997

I had recently discovered that a box of disks that contained my original Copies of Chaos Strikes Back and Dungeon Master were all stuck together in a big mess because someone (most likely my son when he was a toddler) spilled juice in my desk drawer. Dungeon Master works, but Chaos Strikes Back and the Utility disk is toast. I was able to fix the Utility Disk though by copying it onto another disk. It's pretty odd, the original juiced copy won't work, but a copy made from it will. I guess the juice was giving the A drive a hard time but my B drive was still able to read the file. My Dungeon Master works fine, but the disk door has to be manually opened and then it stays in the open position. If I recall correctly Dungeon Master can be copied with ACOPY46, so I'll make myself a backup of it now. I don't think there is anything that will copy CSB though and even if there was my copy is too juiced to try the same trick I did on the utility disk. Did anyone ever crack that game? If so can someone point me to warez site that has it (via e-mail if you're worried about attracting flamers).

Is FTL still in business? Do you think if I mailed them a cheque for $10 and said "I've changed my mind and would like a Backup Disk of CSB for the ST please." they'd send one to me? Hey, it's worth a shot!

I've been having a hankering to make some new versions with that level editor.

Incidently, did anyone else here make a whole whack of character portraits for that game when it came out? I found a disk of DM/CBS character portraits I had made for it too. Anyone wanna trade some character portraits in E-mail? I remember being almost more excited about the utility disk than the actual CSB game itself.

Which characters did you used to choose for that game?

I don't remember their names (I always renamed my characters)
but my party consited of the black wizard, the amazon woman, the big bald sultan looking guy, and the dog.

I had them worked up pretty kick-ass by the time I was finished CSB too. I was always ticked off that you could import DM characters into CSB but couldn't export CSB characters into DM. It would be a riot to restart DM with my characters after they've been tempered in CSB.

Anyone here ever take the Barbarian guy and work on him until he became a kick-ass wizard? I had a friend who did that "just to see if it could be done". You have to first find a magic item that will give him a magic point to start with. It takes a long time to work him up.

Anyone still have their CSB coins? I wonder how many Canadians lost theirs when they accidentally mistoke it for a loonie. Anyone turn theirs into

jewelry? I've been thinking of making a pendent out of mine.
Anyone know what the HH on the coin stands for? Are they the initials of
the artist who designed the coin?

CRACKERS

On 3 Jan 1999 22:40:20 G, Mike wrote:

:MiNT - multitasking Kernal. Does this need N.AES as it needs MiNT?
:N.AES - a new AES replacement. Not free? MiNT needs this and
: this needs MiNT?

MiNT does not need Naes. it can use Naes, or another aes such as
gem.sys, geneva.prg, Xaes,...

:MT-Newswatcher - Newsreader?

Mountain Newsreader is for reading BBS QWK packets, not for the internet,

:Newswatch - Same newsreader?

a prg for reading internet usenet newsgroups.

:Several additions:
:Vfat - changes the type of FAT table on the hard drive. What does
: this run under? Obviously a other-than-tos partitioin would
: be needed, right? Would that be Minixfs?

vfat is what MagiC uses I believe. and window95 compatible file system.
minixfs uses a unix like file system, runs under MiNT.

:XaAES - another AES. Free? Only runs/needed under Mint?

:MiNTXFS - Mint has a file system of its own?
:CDRomXFS - another File system?

xfs stands for extendable(extensible?) file system?
cd-rom uses different file structures, so you can use spin.xfs
for example to access cd-roms.
:
:Draconis - some kind of program

stand alone inernet access, tcp/ip client like WenSuite.
does not work with STing or STik.

:Infiltra - ditto.

email program

:Popwatch - ?

used to download/upload e-mail. not for readinf, editing or replying to e-mail

:PopGem - ?
same, but for MiNT

:Continued additions and corrections would be greatfull.

Matrix TC1208 driven by NVDI 4.12. Usually this card is as fast on
truecolor (32 bit, being 24 bit + 8 bpp overlay) as regular TOS without
NVDI. That's with stuff in 24 bit on the screen. The regular stuff just
flies like a Concorde...

I've tried both Jeneva and Swiss-721 propfonts: not a real problem. But I
don't like propfonts in my AES system, the menu's don't look nice. All the
key combo's, usually sitting in the back of the displayed menu, show up
like shit. Therefore I always used and will use non-prop fonts, but
smaller ones than 10x16 types. No problems at all with N.AES (once I
kicked Wdialog out of the system).

114. Re: What does your ST do??

Newsgroup: comp.sys.atari.st
Date: 1999-01-03 00:00:00 UTC
From: flipflap@REMOVEcoastalnet.com
Message-ID: <GVNj2.3942$P52.20506@news15.ispnews.com>
Source record: 87046

I use dBMAN for a database of customers and orders for my manufacturing business. My dbase command files were originally written on a Heathkit H89 running CP/M and Dbase II in 1982. I ported them to my first Atari 1040ST in 1986. I use a TT now, but my ST is still completely capable of handling the dbase stuff. The ST makes an inexpensive backup just in case the TT goes down, though it's never happened yet.

I use LDW Power for my spreadsheet and Pagestream for creating price sheets, a parts catalog and advertising brochures for the business.

Even though I also own a Mac, and I use other peoples MessyDos computers from time to time, I very much prefer my TT to anything else. It always amazes me that the quality of software for the Atari seems so much better than what I have seen on the popular platforms.

For instance, I was at a friends house a couple of days ago. I tried to read this newsgroup using Netscape on his 233mhz NEC. It was a pain in the ass compared to Newsie. All I could see of a message was about 15cm at a time. Maybe I just didn't have it configured right, but I don't like repeated scrolling just to read a message.

I see nothing wrong with the references. I think you got confused by
the fact that there are two different threads:

1. "Finetuning MiNT" started by Louis on 98-12-29

2. "Re: Finetuning MiNT" also started by Louis on 98-12-30

I guess Louis simply did put in the "Re: " by hand when i started the
second (this) thread.

Btw. Okami has pretty good thread walking functions.

Kenneth, Peter,

that's what I figured too. It simply can't be the editor, since the
headers are not sent to the editor.

BTW, actually I did an F10 to my own msg, without a quote, hence the "Re:"
Perhaps Okami took it as a new thread?

```
The first place to look is probably the Atari ST Quick FAQ.

http://quickfaq.atari.org

The 130XE has nothing to do with the Atari ST line. It's an old 8-bit
computer, like the Atari 800XL, but with 128K and an ST-lookalike case.

The ST range are 16/32 bit computers, with 1Mb (1040) or 512Kb (520).

The rest is in the FAQ.

A Mega keyboard can be adapted with a simple text file that's available on
most FTP sites. A PC keyboard requires an adapter such as the adaptakey,
available from your local dealer.

Unless you have some apps that needs different configs under MagiC and
N.AES it's probably easier to set $HOME to point to the same location
in both OS'es.

>>There's a bug in CF-Lib (which QED use) in truecolour-modes which

That's correct, the problem does not exist under MagiC. The reason for
this is most likely that Christian Felsch can only test truecolour
under MagiCPC and not TOS, Geneva, MultiTOS and N.AES. I have 4.52
myself but haven't tested it in truecolour yet (I only have a 1Mb
graphics-card.) so I don't know if the problem is corrected.

The most commonly used dialer is chat. This is not a GEM-program
though, but you can use my own Connexion (see URL in sig) as a
frontend once you get things running.

Setting up ppp under KGMD is pretty easy:

1. Be sure that the file /etc/ppp/options exists. It doesn't need to
contain anything, but it must be present.

2. Edit the file ~/.ppprc (~ refers to your home directory, should be
on a MinixFS-partition. Default under KGMD is /home/root) according
to pppd's man-file. This is how my own looks like:

```
----------8<----------

/dev/ttyb
connect "/usr/etc/chat -v -f /root/.chat-script"
defaultroute
57600
crtscts

------------8<----------
```

If you read the pppd-docs as well as the README for MiNTnet you'll
soon figure out what this actually means...

It would also be smart to upgrade MiNTnet, so download net-103.tgz,
unpack it and replace the old drivers in c:\multitos.

3. Write the chat-script. This is similar to the dial-script in STiNG,
this is how my looks:

```
--------------8<------------

ABORT 'NO DIALTONE'
ABORT 'NO CARRIER'
ABORT BUSY ""
atz OK
atdt73557000 CONNECT ""
Username: josk
Password: *******
> ppp
```

```
------8<--------------------

I know, it looks complex, but since this is a general chat-tool and
not something specificaly designed for Hayes-modems it must be a
little bit more complex that e.g. STiNG's dial-script.

Basically all you have to do is to convert your STiNG-script, but
if you're using CHAP or PAP you'll need to read pppd's man-file
(which you really should anyway).

Al this looks perhaps a bit daunting at first, but you wanted unix,
now you've got it ;-)

Yep I know that. That's why I spool to a partition with 169 MB free and
still no go. Not enough place free on the drive.
For a test I emptied once that drive. I had then 310 MB free...Not enough
place.

Hmm... I forgot the important part, how to initiate and kill a
connection...

Start a connection: Start pppd from the commandline or desktop.
Kill a connection: Kill pppd (kill -HUP `cat /var/run/ppp0.pid`).

The easiest thing is to either write a couple of scripts for this or
use Connexion.

Well, it looks like I need that frontend from under Mint/NAES. pppd runs
OK, it connects, gives me the IP numbers, I can (from Unix) ftp with it,
no probs there. I got some email transfered too. The thing is, (I
gathered), running with N.AES I need then to get this started (obviously
this is the stack on which clients like aFTP (for Mintnet) and all the
others run. The question was how to get it running from NAES.

> It would also be smart to upgrade MiNTnet, so download net-103.tgz,

>
Actually, I upgraded to 1.01... Fetched the 1.03 tar.gz this afternoon,
but found no binaries in there. I could run the compiler, but prefer to
have binaries ready-to-go. I think you're talking about another tgz
package, mine was mintnet-103.tar.gz from Funet.fi.

>3. Write the chat-script. This is similar to the dial-script in STiNG,
> this is how my looks:
>
Same stuff, it's running already. It was running already the first day
after I finally managed to get the Unix going. Did the changes and it
connected just fine. I can look back into the logs and tell when it
started, after the first few tries since I had one line not completely
right.
>

>Al this looks perhaps a bit daunting at first, but you wanted unix,
>now you've got it ;-)
>
Actually, I didn't WANT the Unix really, but since it's incorporated, why not give it a try too? :-) As said before, just going on low level, I really need docs on Unix first.

The main issue for now is getting my clients from under N.AES going with it.

A second guess is that you looked up your own post in outbound.archive
and pressed F10 from there.

It seems Okami does not include a reference to your own message if
replyed to from within the archive. This might be a bug or feature.
Hard to tell, really. If you follow up to your own post in the actual
news group the references are OK, however.

In case you need to resend a message for some reason the threading will
be correct (if you for instance cancelled the original!), but if you
really want to comment something you wrote yourself it seems best to do
this within the actual group to get proper threadings.

I've a strange feeling that you set everything to 19200 and that mod doubles
that rate to 38400 without anything needing to be adjusted.

It should be possible to set the modem to report the serial port speed (DTE)
rather than the connect speed which should prove the mod.

Atari Computing always hoped that we could eventually go to monthly or
perhaps more realistically every six weeks, but we've never achieved that
aim.

The reasons are quite simple really. Doing a magazine like AC involves a
lot of work, not just the writing of articles, many of which like product
reviews have to be very carefully researched and checked - can you imagine
the nightmare if you slagged a piece of hardware or software because it
trashed your system, only to find out after receipt of a libel lawyer's
letter that it was something else that caused the damage!

The printing and distribution of AC in it's present format is a huge job.
I've no idea how many copies of each issue of ST+ go out, but I know
stuffing 1500 copies of AC into envelopes and making sure each one gets the
correct amount of stamps on it and ancillary paperwork is a very hectic and
time-consuming job.

AC relies upon a very small band of unpaid volunteers, in our case there's effectively only 4 people that do all the admin, production and distribution work in their spare time.

From a financial POV, AC makes a small profit, but it's almost laughable to call it a profit-making business. We couldn't even offer to pay people that write or work for us because there just isn't the money to do so.

AC is a proper business, not because we wanted it to be, but because it has to be from a legal and tax viewpoint. Unlike fanzine type operations, we have to be accountable to the bank manager and the taxman and all those other suits that take a slice of the pie!

AC could publish a monthly publication if we wanted to, but it wouldn't be in the same format as it is now. There wouldn't be anything like the number of indepth well-researched reviews, there wouldn't be room for many of the ongoing features and it generally wouldn't be something we'd be happy about.

I also doubt if we'd maintain the level of advertising support we get now, no Atari dealer has ever asked us to increase the frequency of the magazine because they probably know that it won't mean increased business for them.

Anyway, that's AC's POV.

AFAIC, I see no point in any of us competing with each other, much better for each magazine to develop it's own identity and way of doing things.

We've maintained our circulation at a steady level for a while now, and we're getting a number of new subscribers, mainly because some German Atari users are looking for an alternative to the existing German printed magazine especially now that the ATOS disk mag has closed.

Buy AC, buy ST+, buy them both, whatever suits!

:-)))))))

Kind regards

Mike Kerslake

It sounds like you're implying that PPPkit didn't support PPP. True?

>>STinG - TCP/IP stack that handles PPP protocols. For all STs?
>Also TT's and Falcon's

When I say "All ST's", I mean the Falcon and TT as well. All of them.

***** Another update: *****

XHDI compliant - Extended Hard Drive Interface. Nobody seems
to know much about this standard.
Cab - Crystal Atari Browswer.
Stik - "ST Internet Kit" - a TCP/IP stack that handles only SLIP
protocols. Not used much anymore.
STinG - TCP/IP stack that handles PPP protocols.
Gluestik - A translation layer which lets you use STik/STinG
clients with MiNTnet. [more on this in another message]

MiNT - multitasking Kernal. Does this need N.AES as it needs MiNT?

FreeMint - The latest new generation of MiNT.

MintNet - Net extensions for MiNT.

Minix - another OS.

MinixFS - The Minix File System, MiNT needed (I'm not sure why).

FIFFI - An ASH (the company) FTP program.
ASH Emailer is their email program.

PPPkit - Everything you need to get on the internet. Still a bit
confused about what it can and can't do.

N.AES - a new AES replacement. Not free? MiNT needs this and
this needs MiNT?

MT-Newswatcher - Newsreader?
Newswatch - Same newsreader?

Nemesis - A hardware mod overclocker for the Falcon.
NOSTalgia - Atari ST emulator for the Mac.

Several additions:

Vfat - changes the type of FAT table on the hard drive. What does
this run under? Obviously a other-than-tos partitioin would
be needed, right? Would that be Minixfs?
XaAES - another AES. Free? Only runs/needed under Mint?

Reentrant - some kind of operating system feature?

MiNTXFS - Mint has a file system of its own?
CDRomXFS - another File system?

Draconis - some kind of program
Infiltra - ditto.
Popwatch - ?
PopGem - ?

Continued additions and corrections would be greatfull.

p>
p> Wouldn't HTML have more options and be more compatible.?

Hi Tony!

It might be more compatible as you say, but *much* slower in loading,
specially on slower machines such as the ST because you have to wait ages for
each page to format to the screen width. ST-Guide comes pre-formatted and
even long pages load almost instantly from a hard disk.

Personally I am not keen reading long text passages off screen - but that may
be due to a less than optimum positioning of my monitor which tends to give
me a crick in the neck.

Happy New Year!

Regards
/Peter/

Hi Raymond!

I don't think that Dolmen is a modified TOS but a completely different operating system! IIRC it is/was available on catridge to run on TOS machines, completely replacing TOS (or am I getting mixed up with another such attempt?). I agree the Phenix looks interesting -- if it ever actually appears -- but one must wonder about the price, and whether there will be any applications available for it.

Happy New Year!

GEMGS also prints them out - I've just done a 41-page PDF document on a 4MB STFM and it worked fine, once I had the correct settings selected. An earlier PDF doc that had been created with a font I din't have was less successful, as GEMGS substituted a Courier monospaced font for the proportional original, resulting in letters partly overlapping so that the output was hard to read on screen and in the print-out. Anyone know if there is a way of specifying a (preferably proportional) default font if GEMGS comes across a font in a document that is not available, rather than the Courier?

153. Re: Any real ST stuff going on?

Newsgroup: comp.sys.atari.st
Date: 1999-01-03 00:00:00 UTC
From: chrisc@zetnet.co.uk
Message-ID: <76ospp$6cr$1@irk.zetnet.co.uk>
Source record: 87085

Sort of on this topic,
I'm now doing installations of Mario Becrofts STFM internal (if desired) IDE Hard-disk boards. UK prices are
60 UKP for the basic kit with TOS2.06
5 UKP for a 68-way socket to make it easier to fit (and remove)
20 UKP for installation (plus postage at cost on installations, other prices include postage)
44-way cable for 2.5" internal drives 5 UKP

I currently have a spare 65Mb 2.5" HD, and am looking for about 20 UKP for it, alternatively I can do a ground up installation for 100 UKP c/w 65Mb internal drive and with your choice of wether TOS2.06 is installed.....If it isn't you can't auto-boot......

If you can get to the Wessex Atari Group meeting on the 23rd of January I'll be demo-ing it there, and all other ASP stuff too. Hopefully I'll get round some of the other UK user groups over the next month or two as well....

The IDE interface works quite happily with AHDI (you don't need any wierd drivers or anything) as it is exactly the same as the ST-Book or the Falcon's IDE port. Mario also thinks that with HD-Driver it should handle LS120 Superfloppies in place of the floppy drive (though you'd have to boot from a hard-disk) and with SPIN it should be possible to get it to handle CDROM's on the IDE bus, assuming you've re-cased or can live with a trailing ribbon cable or similar.....

>frontend once you get things running.
>
Hi J-E,

another reply: well, the least I can say is now I'm getting somewhere!
This Connexion was the key I've been looking for. Thanks for that!

Next is getting it running, still :-)

Clicking "connect" results in some lines accross my screen that (my
translation) pppd can't find the .chat-script. It starts up, but after a
few secs it quits again with the line
...chat[35] /.chat-script -- open failed. file not found

When using pppd from the *console*, it's not a problem. 5 mins ago I tried
it again, hooked up, went with ftp to funet.fi, got in, everything,
disconnected and quit again. So pppd finds the script OK running Unix.

However, when using Connexion it fails in doing so. Perhaps some missing
line about a symbolic link in the Mint.cnf???

I've got pppd in the /usr/etc and .chat-script in the /home/root
BTW, this options file was where it's supposed to be too.

So it looks like I'm close to where I should be...

Simple, use Connexion or just start if from a shell in TosWin2 or a
virtual console. Same with clients, most clients (like pine) requires
that you're properly logged in as a user, just log in on a virtual
console or run /bin/login from the desktop.

If you haven't already done so you should check my N.AES-page for more
info on how to combine KGMD and N.AES:

Mike, Mint is the kernel. You need either Minix with it to go Unix style
or a GUI (graphic user interface) to work with a mouse and menu's and all
that. GUI can be N.AES (commercial), the old Multitos from Atari (Gem.sys
which is AES 4.10), OAesis (free, open source project), XaAES (ditto, but
more usable IMO). XaAES now is in a state of getting "workable".
>
>FreeMint - The latest new generation of MiNT.

Yes, Unix clone.

>

Minix is based on Mint. It needs a kernel, like Linux, NetBSD (other unix
clones).
>
>
>N.AES - a new AES replacement. Not free? MiNT needs this and

N.AES needs Mint, Mint does not need N.AES (see above)
>
>Newswatch - Same newsreader?

Newsfetcher, not a reader. Can be used with Okami as the reader.
>
>Vfat - changes the type of FAT table on the hard drive. What does

> this run under? Obviously a other-than-tos partitioin would
> be needed, right? Would that be Minixfs?

VFAT makes it possible to use long filenames and upper/lowercase sensitive.
Can be done from MagiC and Mint. When setting up Minix filesystem, you can
opt for 14 chars, 32 chars and 64 chars. Another one should be "in the
making", going to a few hundred chars, as I understand it. The longer the
filenames you allow it for, the more diskspace it needs. Seems to be the
opposite with WIN98, where VFAT's are said to be using diskspace more
effectively.

>XaAES - another AES. Free? Only runs/needed under Mint?

Correct. See above.
>
>Draconis - some kind of program

Another TCP/IP stack, just like Sting or I-connect.

>Infiltra - ditto.

E-mail program.

>Popwatch - ?

E-mail fetcher, can be used for Okami. Uses the POP3 server, not the SMTP
server, hence the name.

>PopGem - ?

About the same as Popwatch. I think (emphasis on think) it's a fetcher
only.

catch all such messages.

> translation) pppd can't find the .chat-script. It starts up, but after a
> few secs it quits again with the line
> ...chat[35] /.chat-script -- open failed. file not found

Most likely because N.AES's $HOME points to another place than root's
$HOME. Try linking .chatfile and .ppprc from /home/root/ to N.AES's
$HOME, or use a common home-directory. And hardcode the path to
.chat-script in ~/.ppprc.

No, Frank, this will only *display* lower case in the selector,
not read them, unfortunately. The latest MagiC selector will both read
and display lower case and long file names.

Happy New Year,
Charles.

If you're interested in picking up Owner's Manuals for that equipment, I have quite a few (used) that would be relevant to the above items. Let me know if you want any of them:

Atari 8-bit Equipment Manuals:

- Atari 130XE Owner's Manual - $3.00
- Inside Atari Basic (Book by Bill Carris) - $3.00

Atari ST Equipment Manuals:

- Atari ST Computer Owner's Manual - $3.00
- Atari Basic Sourcebook and Tutorial - $3.00
- Atari Mouse Pamphlet - FREE
- Atari ST Basic Quick Reference Guide - $1.00
- Atari SM124 Mono Monitor Owner's Manual - $1.00
- Atari SC1224 Color Monitor Owner's Manual - $1.00
- Atari SF314 Disk Drive Owner's Manual - $1.00
- Atari SF354 Disk Drive Owner's Manual - $1.00

Add $5 for Priority Mail shipping and handling. Please reply to me at: s.winick@worldnet.att.net if you're interested in any of these manuals.

TB> Dave

Hi,

The STe came with an A4-sized Addendum as well as the regular manual.
The Addendum listed the TOS and hardware changes specific to the STe,
including pin-out specs for the game controllers, and monitor port.

Yep, I still have mine (rather battered) :-)

Time eating project?. I did it just in 30 minutes. If you carefully read
the docs and think before you act it rather easy. Mind you I'm really not
a MiNT adept. I hardly understand what's all about but I'm doing my best
and above all I think before I do something.
I think you've enough RAM.

>I would be willing to pay someone to make me an EZ135 disk with all this
>stuff installed. I don't think I can afford to spend the time it takes to
>stumble thru all the problems that Louis has encountered.

Do you think that this should prevent you from problems? You really must
do it by yourself. The problem with Louis seems to be that he acts before
he thinks about it.
He likes to use all the Un*x stuff but doesn't know the commands he must
use. If you don't know anything about this you should better leave this
alone and use the neat Gem progs instead. aFTP, Popwatch, Newswatch,
Popgem, Newsie, aMail, Cab, Draconis, Infiltra, mftp etc,. These program
and quite some others does work with MiNT/Mintnet. I use some of them
dailly. aFTP MiNT version works even better then the Sting version.
Only Mymail seems to give probs.

So now I know :)

Thank ye very much :)

It's a bit stingy though not reproducing a proper manual :P

> Yep, I still have mine (rather battered) :-)

Never saw one, prolly never will.

AM.

I think therefore I AM.

Just want to reply to say that I agree completely!

Of course it is impossible to force hobby programmers to add support for each
and every model and OS, but those who do are giving the atari world a better
chance to survive. IMHO. You are of course one of them, and I believe youre
program has been very important to the atari scene.

It is really nice if more hobby programmers would add compatibility for other
OS's than their own, but it still has to be their choice. I don't consider
myself as a programmer (not yet, at least!) but with the programs I release on
my homepage I make sure will work with most systems.

If I speak for myself, I can't see the fun in releasing software most people
can't use because of compatibility problems. :)

And then, we need to find out what we mean with ST-compatibility, is it:

* ST(e) with only SINGLE-TOS and nothing else?

* ST(e) with Single-TOS, MagiC X.X, MiNT (+ie N.AES)

People, I believe, has different point of views on that one.

Regards,

Joakim

I have an Eclipse mouse for the ST and it's giving me problems.

I have a lot of trouble moving right with the mouse. It's feels like a traction problem or something. The connections are fine and if I remove the ball and move the roller manually it moves left and right evenly and with ease. But with the ball in sometimes it won't move right until I give the mouse a little shake to get it started. It's very odd indeed. Any ideas gang?

Greetings Atarians!

I wonder what is needed to connect a SCSI-cdrom to a STe if I already has a SCSI-card? (to my old ICD-drive)

- What speeds are possible?

- What software is needed?

I checked in quick-FAQ, but links were broken.

Thanks in advance,

Joakim

Clean the ball and rollers. You can wash your mouse ball in warm water and detergent. For the rollers, try some isopropyl and gently scrape off the build up.

Peter,

has this always been the case with my msgs since I switched to Okami?
Can't be the QED setting, since the headers are left out on editing. Then
again, QED is set to leave existing text as it is, and format only the
inserted text.
I know that Newsie sends the whole bunch to the editor, therefore this
setting is important for working with Newsie.

It looks great in 16 colours, best looking mailer I've seen so far.

>Me too have serious problems with Mymail but only when I use MiNT/MiNTnet.
>Most of the time the mail retrievement is aborted before I get my mail.
>Sometimes Mymail crashes so seriously that it take the whole system down.

Well I had no problem collecting mail with it (using STiK), reading and
replying to mail. However, I encountered something rather unusual the
other day when just after finishing my reply I returned to the main screen
only to find that the screen index of received mails only showed the file
sizes and no names or subjects!

I looked at the mailtext file and that appeared okay, and there was no
subsequent report of disk corruption from CORRECT. I deleted all the
indexing files created by the program and relaunched it. After a rebuild of
the MAIL.IDX file everything appears as it should be. No idea why this
happened, but life itself is a mystery!

I'm still using NEWSie because I like the all-in-one news, mail and ftp
idea. I also like the fact that NEWSie allows you to use CAB as a browser
if called by holding the shift key down in a MagiC environment - never got
the browser side of NEWSie to do anything other than connect to the first
page of site, it then always gave up!

One of the few bad things about NEWSie is it sometimes trashes email for no
apparent reason. Mail I have received and read before quitting is not there
on a restart - searches through the mail folder looking for the file
specified in the .MBX file show it just isn't there! :-((

This is an occasional problem, but I now take the precaution of filing and
printing of any important email before quitting.

That aside, I find NEWSie a good program by and large. I've stuck with
v0.90 because v0.92 was problematical on the multiple mailbox side with
some nasty mail corruption and losses (on my system anyway). I only use
0.92 for ftping files to my web site - older versions of NEWSie didn't
support the protocol used by CiX.

V.0.92 is the only version to download the CiX FULL GROUPS listing and
write it to disk successfully though.

Kind regards

Mike Kerslake

I think that the best demo around on the Falcon that works on VGA is
Sonoluminesenz by Avena. The Lost Blubb is probably second best.

I don't remember where I downloaded it from, but its definately not
available at the Dead Hackers site as given to you from AtariMad. Do a
web search for "Sonoluminesenz" (which is the correct spelling!) and
I'm sure you'll find it (its also a scientific term so you may come up
with a few sites that are not Atari :)).

Cheers!

Hello,

I'm writing an astronomy program called 'Universum'
for the Atari computers. A resolution of 640 x 400 is
a minimum. It is still under development, but it can
already read the SAO catalogue (more than 200000 stars
up to magnitude 9.9!!). You can download it, together
with an old version (with more possibilities, but with
less stars) at my homepage :

http://welcome.to/universum/
or
http://www.geocities.com/CapeCanaveral/Launchpad/4567/

If you have any suggestions, feel free to mail me.

Greetings and clear skies,

Wim De Meester

>
yes, long file names. All my partitions are TOS so on them there are
no long filenames. Maybe later when I figure out how to use the VFAT
from the newest MiNT. I have used up my partitions so no space for
Minix.
Sometimes I run into trouble when i download stuff with long
filenames. When they land up on TOS-Partitions I get logically
shortened names.
Now I have a Mint-RAM disk. I put the download stuff there and I keep
the.very.long.filenames.
Then I put in the ram-disk the detar, decompres, de-lzh, gzip etc.
to get to the real contents. Then I can save on a minix-floppydisk.
I had some trouble getting programs working from the ram-disk, but as
Katherine pointed out: not only long filenames are possible but also
the file-flags are used now. I am looking into the manuals to find
how to set them.

Further:
best wishes for the new year!

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST

Yes as long as you keep it simple and uses N.AES: no problemo.
The last version of N.AES from germany installed ok.
When you want more (network etc, more users, more terminals..) I
advice the MiNT98 disk (also from Germany (CD).

I quote the small german manual (translated):

-the nano-distribution
you get an ethernet connection to another (ethernet) computer.
With Thing Desktop 730 kb RAM, so 1 Mb is enough.
You can also import NFS-compatible network drives and use all TCP/IP
clients (Mail, WWW, ftp...)

-normal distribution
2-4 Mb RAM
export network drives (SMB and NFS), network printers and all TCP/IP
services as client and needs a Minix partition

-big distribution
all functions you can expect from a Unix-system user-administration,
server functions, mail system, SQL database
needs 3-9 Mb RAM (and 100 MB diskspace Minix)

Hi Marcel,

since I'm very interested, especially whether or not it would also run on
my system (TT with GFX card plus MagiC, or without MagiC) I took a look.
Clicking the "universum" link only displays an empty page...
The other links worked OK, like the ATM one and the "photographs".
So for the time being I'm unable to fetch the programs :-(

>how to set them.
>
Ronald,

just add the lines

NEWFATFS=CDEFGHIJKLMNOPQRSTUVWXYZ (choose whatever partition you actually
want)
VFAT=ditto

to your Mint.cnf and you're set.

I have all partitions on my second drive set to VFAT (also from under
MagiC) and changed the download path to i:\temp instead of c:\new, just to
get those long filenames in correctly. Same drive accomodates gzip and
tar.ttp's. For MagiC max size is 32 characters, I set the minix stuff to
go to 64 chars.

As for your other msg: well, actually I see the wood, not the trees :-)

Just sent a long email to Ronald Hall explaining things. In fact the minix
runs perfect, so does N.AES (apart from some GLITCHES, which some people

translate into "Lewey's taking the P... on N.AES; well, actually it's not like that at all.
As for a replacement OS: just fine. The bloody problem is the Mintnet stuff, I can't get it to work. Read the docs! Did YOU read them? Which ones? The Mint.hyp? Try to look into the Mintnet section, see what it comes up with on "Mintnet Installation etc"...
Well, I told Ronald already it's probably because I'm getting too old.

Also told him that if by wednesday this stuff ain't running decently, it goes into the bin. Don't worry, I'll finish my piece on N.AES alrite, but I don't like to switch back and forth between Mint/NAES and MagiC, because simply under MagiC I can get to the Internet decently, not so under the other one... So I will send back the disks with N.AES after I'm finished with it. I'll just keep the Minix and Mintnp.prg to experiment with XaAES for future releases. No problems with that. And the Unix stuff mite be interesting to get into a little further.

>> two months ago, drivers for PCI and ISA ethernet-cards...

> That's all recent stuff, less than 2 years ago ?

Actually most of this was done in 1998.

>> Bollocks. Ever heard of fVDI?

> I haven't. Looks to me as if you MiNTers have a problem getting news around.

That's weird, fVDI has been mentioned several times on this newsgroup,
and my impression was that most people knew about it. Please note that
fVDI isn't mainly a MiNT-VDI, but a general VDI-replacement that works
(or atleast should work) with TOS and MagiC as well. Most of the
development is actually done under TOS...

> I had heard of some attempts to create VDI replacements, but to my knowledge
> they are no more complete than the open AES replacements.

fVDI is nearly complete, and will be delivered with Titan's
PCI-interface (Eclipse) with ATI Rage drivers.

My view (and a subject dicussed in my column in the next AC) is that programmers releasing stand-alone new programs should not rely on other programs to do any of the basic tasks. Rather they should write their applications to function happily within whatever environment they find themselves in, ie TOS, MagiC etc, but then take advantage of anything extra they detect.

Everest is a good example of this, it does it's job very well, but if it detects NVDI or Speedo it allows you to take advantage of their font and printing systems, but if if they aren't installed you can still print files direct to your printer. It can also function as an excellent web page editor/designer with CAB if you have MagiC and OLGA installed, and you get immediate updates on screen.

But at the end of the day it will still run on every system with minimal overheads.

Ideal way of doing things IMHO :-)

I have a feeling, but I'm no expert, that it maybe the text editor used that screws up the references. I used Everest, but it reports when importing postings with a long reference line that's it too long and it cuts it off.

I've just switched to QED because that doesn't do the cutting off when a line limit is reached. Now I'll have to learn QED because I haven't found the auto word wrap!

;-)

Please note that the N.AES/MiNT installation on the Milan is very
MagiC-like, with no unix-like features at all. It's basically just
MiNT in the autofolder and N.AES on top of that. This gives you an
environment very similar to MagiC.

It's true, it only works as intended with MagiC. I've had nothing but
trouble with MiNT and TOS, and the only reason for not downgrading to
4.12 again is the new HP670C-driver...

Btw. has anybody had any success in printing to a file with NVDI 5.01
under anything else than MagiC?

>- What software is needed?
>
>
Hej Joakim,

just forgot about this one...

Erm, you can go Metados (2.7) or Metaxbs (in the Spin! package). Next are the drivers (all in the Metados stuff). Next you need a config.sys telling the system where the drive should be found (ID nr etc) and what drive letter you assign to it. Depending on whether you run TOS/MAgiC/Mint you can use the spin.xdd or spinmgc.xdd drivers to get access to long filenames and upper/lowercase names. Figure that ain't possible directly running from TOS.

I'll send my config.sys as an example:

*BOS, c:\auto\hs-cdrom.bos, A:12
*DOS, c:\auto\hs-iso.dos, P:A

The A:12 means my SCSI ID for the drive is 4, the P:A states that my CD-ROM drive letter is P.

The Metados package comes with drivers and explanation. Shouldn't be big trouble. It's pretty much self-explaining.

If you use the Spin package, there's another driver spinsomething.bos or dos too. I'm using Metaxbs on the drivers as mentioned in the config above and it works fine, giving me long filenames as well.

Speed: I should go for the 4x drives. I gather the STe bus won't give you more speed from a 32x drive... Well, actually those higher speed drives don't cost that much, so it's up to you. Maybe for future development on your side you could go for a 16, 24 or 32x drive for about the same amount of money and perhaps then a 4x speed drive mite be too slow for you.

The other way is Extendos/GOLD or whatever. It's commercial. Think it's Anodyne Canada (have I got the name right?) selling it.

Depending on the harddiskdriver you're running you might have to activate
the scsi id first before it's seen. Hushi sees it right away at boottime,
hddriver needed to be activated on the id first.

> can print in 300 dpi greyscale again but 600 dpi is still impossibe.

NVDI spools to disk (c:\gemsys\spool\) when it's short of memory, I
noticed this a couple of weeks ago when 20Mb free RAM wasn't enough
for printing a single picture and I had to free 35Mb on my C-drive...

There is a problem with Thing's AES-library and proportional
system-fonts. Try it under MagiC6 with the same fonts, the problems
are still there.

> Otherwise, for the time being, I think N.AES is just fine. Well, didn't
> like the N.FSEL either. So I stick with Freedom :-)

Freedom is fine, I use 1.15e all the time. It's a bit nasty though,
not only under N.AES but all systems. I've found that the best
solution is to install both N.FSEL and Freedom, in this case N.FSEL is
used whenever Freedom fails. You can also enable/disable N.FSEL on the
fly by selecting it from the accessories/apps-menu.

There's a bug in CF-Lib (which QED use) in truecolour-modes which
affects checkboxes and radiobuttons.

A bit off-topic now, but MagiC-style shared libraries can also be used
with MiNT or plain TOS with the latest MetaDOS installed. I don't know
of any applications that use them yet though.

How long did it take to understand first TOS and then MagiC to such a
degree that you could fiddle around with it and configure every little
part of it? And really understand what was going on? A week?

You're too impatient, starting directly with the most complex
MiNT-setup and expecting to understand everything, configure it
correctly and have everything running smoothly within a few days is
rather optimistic...

Compatibility is a good question. I write for many platforms and can
only hope that my ST PRGs run on anything as I only have an ST to write
and test on. I suppose if one is well liked with other user/prgmrs
that one could work with others on the issue of compatibility.
:
I'm hoping, because my ST should be the bottom most rung, that it will
run on any ST. But over on the Amiga I found A PRG I thought to run on
the A1000 wouldn"t even run on 512k. I will be redoing code, but this
is an example where I found out in time, and only because I had access
to the smaller machine.

It is something strange!
Okami usualy properly supports reference lines in headers!
Check my header please!
Maybe it is a problem with a MiNT?

<<Programmers are lazy, and especially hobby programmers are to often careless regarding what their stuff does on other machines, other OSs>>.

Hello

Perhaps I'm taking your statement the wrong way, or perhaps even out of context. If so, I apologize for posting this. But with all due respect,I disagree with your above statement about "hobby programmers".

In my opinion, anyone who takes the time to write an Atari program and then freely shares that program with other Atari users should be commended.

I, for one, would not call a programmer lazy just because his effort only runs on an ST, or an STe, or a Falcon. Many "hobby" programmers have written excellent programs for our Atari's that we non-programmers use and have come to depend on. And many of them ask for NO compensation at all for their efforts. Unfortunately, these "hobby" programmers also receive little or no recognition and Thanks, either.

People like Tony Greenwood and Deanno (Silly Software) have made using my Atari ST an enjoyable experience and I have nothing but the utmost respect for them and all the other "hobby" programmers who have shared their work with me.

Thanks to all those who continue to support the Atari platform in all capacities, from writing programs for the ST, STe, Falcon, TT, and Portfolio to writing & publishing Atari Computing and ST Plus Fanzine.

J-E, you do have a point. I probably took too much by going to Minix, plus Mint/N.AES at the same time. For the time being, the minix stuff is on very low level. As for now, this N.AES stuff runs decently. The only trouble is the Mintnet stuff. Can't get it to work. And although Sting runs OK too, it's a bit flakey: I need to really EXIT Sting after every run and start it up again to get my modem running. With MagiC I could simply disable it, leave it in the background and enabling it again when needed and do the next run.
I'm probably missing just one small item on Mintnet to get the clients do their stuff, like I explained to some others: I figure I need something like a Dialer to connect. Not the Sting one. What would that one be?
I tried STiK 1.12, but I figure it's slip only. Anyway, doesn't connect. Got all these stuff like sockets.xdd sitting in /multitos, but there must be one app to start everything, like Sting in the auto under MagiC, then calling the dialer to set up the connection. By now I just don't see any separate trees in the wood any longer... :-) The Mint.hyp or Mintnet.hyp I have misses too many sections either: no use.

I feel a bit like the child sitting on the toilet for the first time alone, and doesn't know how to do it. So "Mommy, how do I finish it?" Mommy, watching her favorite soap, "take the paper and wipe it clean"... Child can't find the paper but gets all sorts of answers except for where to look for the paper... Got the picture? :-)

Well, saving them both under MagiC and from N.AES resulted in QED at least
getting its configs right again.

I think Martin said that 4.52 has no longer problems... Haven't tried that
one yet. OTOH, now *that* the configs are OK running on both systems, I
can live with the empty white boxes. BTW, this bug doesn't show when
running from MagiC: no problems whatsoever... And I do run 32-bit mode!

212. Mitsumi Floppy Drive-replacement 1040ST drive

Newsgroup: comp.sys.atari.st
Date: 1999-01-04 00:00:00 UTC
From: Alyre Chiasson <chiassa@umoncton.ca>
Message-ID: <36910AC1.8109FBE3@umoncton.ca>
Source record: 86945

I need to replace the floppy drive in my 1040ST and have picked up a Mitsumi D359T3. I understand you can use a 1.4 MEG drive but will only be able to read and format 720k, which is okay for my use. I have found the jumper settings on the internet for this model. However, they give what they call numeric codes and alphabetical codes and twisted cable and straight cable for both A and B. What are these? I was expecting settings for just plain A or B. I have also heard that you have to reverse the cable in the 1040ST from what you would normally expect. Is this correct? How do I arrange the pin alignment? Perhaps this drive won't even work?

Thanks for the help.

> is reporting?

Demon's Colt numbers do not support 56k connections, you need to try the
Energis number(s) or the Green number for 56k access.

Energis: 0845 079 8666

I'm not sure about the Green number.

Those are maximum possible figures for V90. Personally I only connect
at 44.4k and send at 28.8k (these are average figures).
It depends on the quality of your phone lines among other things.

I just tried that Derryk with the same results, ie. 2 bombs.

<>It should be possible to set the modem to report the serial port speed (DTE)
<>rather than the connect speed which should prove the mod.
<>Rgds, Derryck

With my switch in the 19k2 position the STiK dialler reports 19200
Baud, thats with INIT=ATZ in the DIAL.SCR with the switch in 38k4
position I don't get that far, it just locks up with Zetnets
telephone number. Its looking increasingly like a problem with the
mod. I'll just have to find some time to go over it with the
magnifying glass.

I'm not sure about setting the modem to report the serial
port speed, as I said I'm just using ATZ. I'll have to consult the
manual and experiment a bit.

Thanks for your advice
Cheers

STiNG reports the connection speed between the host computer and the modem, typically with my Falcon (invariable in fact) that is 115k2. On text files and non-compressed things the modem will allow for a fair amount of hardware compression, so even thought the modem is only transferring 5k6 across the phone it is compressing and decompressing on the fly toi get some silly figures....I've seen 9k sustained for a 50K text file ....Word of warning to people considering the upgrade to 56K...

Modem negociation on my no-name Rockwell chipset thing takes over 30 seconds...get used to some funny noises :-))....anyway I don't think you guys should upgrade, you'll be using bandwidth I want :-)))...especially if you're on Zetnet......

>the parts together and "rolling my own" is going to be worth it :)
Well I did think along the lines of rolling my own as well. You see I currently have an old PC which I will be replacing shortly which should leave me with a PC-AT mini-tower case and 64Mb of 72pin EDO RAM (it also leaves me with a ATI Mach64 PCI graphics card, but that one doesn't seem to be supported by the Milan :-(

Also I am pretty sure I could get a decent capacity EIDE harddisk and CDROM (plus possibly an S3 V64+ graphics card, though whether the latter will work with the Milan (remembering the large number of ATI Mach64 variants which wouldn't work with the NOVA!)) fr less than the Atari dealers are asking for similar.

I spoke to someone at System Solutions and they didn't seem that interested in selling me the motherboard kit only, more interested in selling me a complete system! Maybe I need to try and talk to Karl or El?

I could also try Titan Designs on this front who also seem to stock the machine (though again no mention of anything other than complete systems).

>(http://www.milan-computer.de/html_gb/index2.html) and while my German
>is rusty :), I do believe they announced the availability of the SCSI
>card. You might want to check the above link.
Yep, been to the site and it says something like support for NCR SCSI cards is being worked on. Shame it isn't the Adaptec 2940 as I have one of those coming out of the above mentioned PC, though I can always use that in the new PC to help keep costs down.

> In any case, if the Milan truly has been selling as well as I've
>been hearing reports on (though I'd like to hear an official one),
>you'll be sure ASH will want a part of that market....
Indeed, though rumour had it that the Hades version only came about after some agreement between the Hades developers and Ash.

Glad to hear it. I will look forward to such a machine making an
appearance over here :-)

Though on this front is the motherboard a new design to accomodate the
'060 or is it the original '040 board with the '060 fitted as an
upgrade?

>The SCSI card and driver are available since some weeks now, and except
>ScanX, I did not get problem reports.
Hmmm, I wonder if my Nova scanner driver will work. Do you have full
control over the CPU's cache settings (both the 68040 and 68060
versions)?

>Magic is being worked on, but this might still take some time - the hardware

You have 'numapps' set. Connexion checks that the number of possible
applications == -1 (recommended in Atari Compendium), because this is
the case in MultiTOS and Geneva. Not very clean, I know, and it will
be changed in the next version (whenever *that* will be...).

> Louis, btw, don't use Speedup program, and multistrip.
> They come with naes package, but they will eat up all your CPU cycles..

Thanks for the kind words Katherine, but I would like to point out
that the latest (1.4) version of MultiStrip is almost as fast as
Taskbar. Taskbar is still a lot more responsive and totatlly free, so
I'd still recommend it ;-)

Hi all,

Is this a classic question ? I have an Atari 260 ST in the attic, which served me well while it was still functional. Now I have thousands of pages of text under 1st Word (the word processor provided with it), which I cannot use in my current PC environment.

My search for an emulator of sorts on the net has been in vain. Anybody out there know where one can be found ?

Thanks !

Karel Smolders

Hi Charles,

I can't take the credit - I soaked this info up last year from this
very NG :-)

CS> >This might solve a problem with the disappearing mouse-pointer
CS> >in, eg, Profile when clicking a submenu item: I'll be back if it
CS> >doesn't....@@@@@
CS>
CS> Later (2.1.99): it doesn't! Magic6 & NVDI 5 installed, the sub-
CS> menus do not work at all and the mouse-pointer disappears.
CS> It used to work properly under MagiC5 and NVDI4.

This is strange - XMEN_MGR.PRG is no longer even on my hard disk, and
submenus are all working fine (even the SUBMENU.CPX works). BUT, I
don't have NVDI at all, let alone v5...

I don't know about this mouse-pointer problem - could you tell us more
about it? (I suppose you've already done the obvious: dumping out
everything from the AUTO folder, etc.)

CS> Eheu...!

There, there. It happens to all of us ;-)

CS> Happy New Year!
CS> Charles.

Happy New Year, New MagiC, New NVDI, New Britain...

THE VERY BEST OF THE BEAST
****

Since a few days I attentively read the news about MagiC! and MInT ...
Please, let a simple user give his poor opinion ...

Ten years ago I bought a 1040 STF which I considered a dream to own at this time ... After having invested thousand hours to extract the very best of the beast, I began to think about buying a new desktop ...
At this time, it was possible to buy the fabulous Neodesk in french ... so I bought it in its 3.02 version ... It really was fantastic to rediscover all new possibilities and go further in esthetic windows, desk and dialogs ... Dan Wilga surely is one of the best interface designer in our world ... and not yet equalized at this time (just my opinion of course ...)

After having used and used my 1040 STF without any harddisk I bought one second hand Megafile 30 ... the dream really came true at this time and I saw what I had missed during all this time ... But, please remember such a piece of hardware wasn't really cheap at this time even bought in second hand ...

Then, I believed it was time to put more memory in my good old beast and succeeded to insert 4Mb with the help of an english third party seller ... (don't remember the name right now though ... oh yes, it was Marpet or something like that ...)
At this time things went further and I put a 16 mHz accelerator in the beast ...
I wasn't yet happy with that and when a big french shop AUCHAN liquidated a lot of brand new Mega STE at the silly price of 1990 FF (about $350 I think ...) I bought one and then two and then three for Midi Comedie members ...

... and believe me or not, I wasn't yet happy with both my machines ... The Mega STE needed a graphic card and when I saw somebody selling it's Mega STE Crazy Dots 1 equiped I did not resist at the temptation ... though, I had not enough money to buy the whole beast because the owner was selling something very complete and unaffordable : a 10 Mb (yes!) updated MegaSTE with a Crazy Dots 8 bits graphic card ...
But I succeeded to buy only the graphic card ... simply after having waited one year and phoned again to the desesperate seller ....

Connecting a graphic card is one of the greatest pleasure you can have in your average computer "amateur" life ... everything is then transcended by the colors and believe me 256 colors was enough to pacify my poor mind ...

... but not for a long time ... I decided to sell my genuine Mega STE (without the Crazy Dots of course) and my goal was to buy the complete 10 Mb equiped MegaSTE ... again I succeeded in my goal ...
Time did its job again :)

A fantastic machine completely equiped with it's brand new Neodesk/Geneva OS and desktop ... Neodesk precisely came with it's fantastic color version at this time ... of course at this time I needed NVDI ET4000 to go even further in speed because working without this program was so slowwwwwww on the Crazy Dots equiped Mega STE ...

... but my mind was always tortured by the desire's evil and I was looking to find a TT030 which was (and always is ...) a speed demon by itself ....

... a few years ago I had collected about 5 TT030 owners who wanted to sell their beast and I was waiting they accepted to diminish their prices ... again I succeded to buy one of my current TTs at a really good price ... It also was accompagnied by its TTM195 ... What a screen (I continue to use it when I'm editing web pages ... because even a SVGA 15' is so little aside this black and white monster ...)

One year ago I found a Brussel Atari seller who was selling two VME Nova Mach32 for the price of a five floppy boxes each ... I wasn't so interested because I liked my Crazy Dots and did found the 16 bits module by Dan Wilga summer bargains ... but when I saw it was possible to extend even further resolutions and easily reaching 32k colors, 64k colors and even 16 millions colors I dived into "desire" hell ...

Today, I own and intensively use my two graphic card equiped TT030 ... and have just switched from Geneva/Neodesk to MagiC! ...
A friend of mine called nightowl wasn't really happy to see I was leaving the MinTNET world to come in STinG world and above all he hated MagiC! ...
But it was my choice and I found it good until I saw I couldn't get aFTP working as far as before while trying to upload to my websites ... until now I never succeeded to completely replace the MinTNET functionnalities when speaking about internet ftp upload functions ... in fact I never succeeded to upload anything while using STinG under MagiC! ....

But the story is endless ... today I'm using MagiC! with Thing 1.09 ...because I really like to remove white strips under desktop icons ... Also, about icons I must say I began to convert my 600 icons made under the genius Neodesk icon editor ... but, shame (or honnor) to Dan Wilga ... it doesn't exist ANY converter between *.NIC and *.RSC ... so after having begun to clipboard and clipboard again all my icons I finished to abandon the idea to recover all my icons to use under another desktop ... so today I'm reduced to use an iconless desktop (more and more buddhistic than ever ...) because some authors refuse to use the same icon format ...

I don't want to speak further more about my computing life which
really is endless because I continue to unreasonably to love and
adorate this f..... atari computer ...

My lesson is : there are plenty of OS : MinT, NAES (not yet tested
Martin ! ... hum maybe this year :), MagiC!, Geneva ...
there are plenty of alternative desktops : Neodesk, Thing, Kaosdesk,
Jinnee, Nodesk ...
But you'll never be happy with any of these combinations because
nothing is perfect. While talking about computers that's always true
(even while talking about Atari ...) and nothing is more imperfect
than a human being ...
And as you know human beings are the only responsible for their
worthless creations and desesperate desired acts.
So, at the beginning of this 1999 year I send thousand golden
peaced mind wishes to any people acting here ...
I don't want to discriminate NAES users, nor MagiC! users neither
anything else users excepted if they work on something other than
a TOS compatible computer :p ...

DC> that rate to 38400 without anything needing to be adjusted.

Hi Derryck,

Oo-err... nothing like the serial port upgrade I have then! But it's
easy for Mike to test this (assuming he's not already tried) :-)

DC> It should be possible to set the modem to report the serial port speed (DTE)
DC> rather than the connect speed which should prove the mod.

Now that's the opposite of what I advised :->

Thinking about it, I suggested DCE reporting 'cos Mike would have
already had it reporting DTE (default). But I think (from testing I've
done here recently) that either way will be fine:

```
| Serial upgrade
| On | Off
-----+-------+-------
DTE | 19k2 | 38k4
DCE | 19k2 | 28k8
```

Assuming ('cos I can't remember exactly) the port upgrade is for 38k4,
and the modem is a 28k8.

IOW, under DCE the modem will only connect at 19k2 IME.

Hi there,

Running my faithfull Ste:

My old SM125 is loosing its horizon, e.g. it's going
under(?) in the down-right corner. (oblique, leaning?)
What would be a nice replacement?
I recently purchased a Smile 15" for my falcon and
it's great, and the old faithfull SM mon looks really
bad now.

Any suggestions/ know how?

Regards, Guido
Thanx

To the best of my knowledge all this equip. works unless otherwise noted.
Since it is used and dormant for some time I have to sell it without warranty
and at the buyer's risk. Shipping is extra for all items.

Here is what I have:

System A:
Atari TT030, TOS 3.06 w/beetle mouse, no monitor, no manual.
1.44 MB floppy
120 Meg HD
4/16 Meg Ram on GE Soft internal board
Math coprocessor
Maxcess 88 MB removable HD with one disk.

I am asking $250 (plus shipping) OBO for this system.

System B:
Mega 4 ST w/t25 accelerator, TOS 2.06
1.44 MB floppy (as I recall?)
Spectre GCR w/documentation and software
D&P full footprint under monitor HD bay w/Syquest 44 MB removable (three disks,
one set-up to boot Spectre) and 105 MB Quantum HD (which does not work, sticks,
unless you bang it from the side).
Atari Mouse
Atari SM1225 mono monitor.
Supra 2400 Baud modem

I am asking $150 (plus shipping) OBO for this system.

Misc. Pieces:

Migraph full width hand scanner
Practical Solutions Cordless Mouse (no battery door)
RGB Tech. Synch Switch
Migraph Hand Scanner tray (can't find the hand scanner)
I am asking $50 (plus shipping) OBO for these pieces.

Applications (all with orig. disks and docs) as priced or OBO or all for one
price:
Calamus $20
WordPerfect 4.1 $15
Pagestream 2.2b (last version, I do believe) $20
Datamanager ST $15
Datamanager Professional ST $15
WordWriter ST $15
Easy Draw $15
Interlink $10

Juggler $5
HiSoft Basic $5

Also:
Dynacadd with dongle and documentation $35 (plus shipping) OBO

Cricit Point-of-sale small business program: $35 (plus shipping) OBO.

Games (w/boxes and orig. disks):
Red Storm Rising
UMS
Empire 2.0
Leisure Suit Larry
Terrorpods
I am asking $35 (plus shipping) OBO for all these games.

Hi,

Anyone using AtarIRC v0.9x or FracIRC v2.00.

I've been trying to access some channels at toronto.on.ca.undernet.org, port
6668 and channel #f1modelers with various IRC apps.

With FracIRC everything seems fine until I go to join the channel, then I
just see "-- Attempting to joing #f1modelers --" and it never joins.
Eventually I get messages like "JOIN - Register First" ,etc.

With AtarIRC I get messages like "JOIN - Register First" ,etc. as well.
Any thoughts as to the problem?

I'm using STiK v1.12.

TIA

>
Katherine,

well, it runs... Changed some configs again, set up Toswin2 and now it's
OK. The first testrun from N.AES:

Newswatch: terrible slow newsfetching. 50% or less than with Sting.(Could
be a config not found, hence D/L in "safe mode"?
Popwatch: it got stuck on D/L email. Got the headers displayed, selected
one and it got stuck. Had to kick it out using Multistrip.
aFTP (mintnet version): bloody fast, faster than Sting version.
Newsie: slightly faster than from Sting. Problem at "disconnect from
host", had to kick it out too.
CAB (using the old OVL, not the Mint one): good speed. Not really
different than with Sting (tested this on my own homepage).

The end of the session was with Newsie, and when I tried to kick it out
the whole bunch froze up...

But at least the stuff runs. Rest is probably finetuning :-)

I will put Speedup aside and check out Taskbar. I'm running MStrip 1.3
here, believe there is a newer version.

Well, I said "before thursday", didn't I? Looks like the bin remains empty
:-)

Looking back, not all that much trouble <VBG>... The bloody start when it
simply wouldn't install. Then when that finally had succeeded, the bloody
stupid Mint.cnf on my root, where it shouldn't have been, and was
certainly not before, but prohibited getting to the Unix stuff. Oh yeah,
this stupid (sorry) VI editor. Well, Pico does a nice job too. Then of

course the configs and getting used to a multi-user environment. There's a lot more to learn, but I'm catching up already... :-)

Tks again for a big help! Same to Joska and everyone else who desperately tried to get an even more desperate Louis back onto the track...

(Now that doesn't mean the questions have stopped...)

Well, the thing is that I never experienced any problem running from MagiC
with the most different (non-prop) fonts. For some time I had a 7x12 type
sitting in the AES, but on my monitor it becomes too small. Now use a 9x14
type, which I like very much. No problems either.
Years ago I ran VDIfont.prg on GDOS, AMCGDOS, GPLUS and NVDI, also with
this 7x12 font and no problems at all too. Only, sometimes an alertbox
displayed a mixture of this font and the systemfont.
Actually, I haven't seen much problems using this 9x14 type with N.AES,
just Newswatch and Popwatch missing the last character when displaying cps
rate, total amount of bytes recvd and number of msgs expected/rcvd. Funny.

>
Erm, got 2.03 here. No probs at all... Only from MagiC using Aniplayer, it
used the Magxdesk fileselector. Didier explained why. Haven't tried from
N.AES yet... but I gather it will be the same. But I've got the option
"use AV-server" not selected. When doing so I experienced the fsel not
coming in as it should be on occasions.

Not that I've heard of. I can't remember the name of the packer for
Mac, but I think later versions or SIT packer can handle them.

The Mac has a different standard for executables than most other
machines. The files are divided into two parts, one resource part and
one data part. This is why you can't really make a packer for Mac
execs on other machines..

Hi Ronald,

for what I'm worth: yes. Last time I fetched my complete list it got all
and put it all in the list too. No probs. File is around 700 kb.

>CAB (using the old OVL, not the Mint one): good speed. Not really
>different than with Sting (tested this on my own homepage).

Rite, before people jump on me: I did another one. (Have been switching
back to MagiC in the meantime, now again on Mint/N.AES).

Meanwhile removed Speedup from the config, maybe it has to do with it.

Newsie: no more problem.
Popwatch: no mail available, so couldn't check. Connecting/disconnecting no
problem.
Newswatch: same speed (about) as usual.

So it looks like it's OK now.

Wow - your world must be pretty tightly focused. I would say
the space shuttle program is well established, yet not
everyone has one. I'm still waiting for the cereal box
version.

poodles are a well established breed, yet few people have
them, compared with other breeds.

You always flame people in this newsgroup. Why don't you
establish yourself as a "nice guy."

I've seen other postings where that happened, they have a truncated References
line. This posting of Tom however does not show any trace of that line. So if
the editor were to blame, it had to abolish an entire line. Unlikely ... ?

Well, missing References are just as wrong as faulty ones ;-) Missing ones
can be interpreted as you did, but a reader destroying the line gives indis-
tinguishable results.

I do not feel like checking all the time if people use proper news
readers ;-) I occasionly mention it to make people aware of the
problem, as for the reader it's an RFC violation, so must be considered
a bug. It denies readers capable of threading the luxury of enjoying
it, so no big deal.

> I'm
> not even sure that it is Mountain Reader that is causing the

Is that a real BBS, or do you post to a news server ? If the first, then
you might be right here.

> cause the newsgroup people a lot of grief? I cannot see it from
> here, and if it is so bad that it requires fixing before I can post
> again, my only real option is to shut up.

Nah, it's a little nuisance, not more. No reason to shut up if you have no
other option.

> What do the header reference lines do for you, anyway?

The lines tell the news reader to which posting the current one is a reply
to. Modern readers build a message tree from this, and this way show graphically
the way how the discussion went. It's a very convenient thing which you will
miss badly if not there in some client after you used it for a while.

> I will send this same message out via microtalk qwk reader, and you could

Actually, STinG just reports what your modem reports. In most cases,
that's NOT your DTE rate (shown in your example), but rather the DCE
(i.e. connect) rate.

Reporting the DTE rate is pretty worthless, IMO, since I already know
the DTE rate. I want to know what speed I connect at with the other
modem.

If moving the rollers works as expected then you have no mechanical problems. Clean the rollers (a ring of dirt soon builds up around them, can be picked off with fingers), the ball and the surface the mouse rolls on. Really works, makes the mouse like new :)

P > Maybe your reader is stupid enough that it does not show you
P > the consequences of it's behaviour, but others do show them.

Peter, this is the second time you have mentioned this as a problem. I note that you are the only one who ever has. I don't know what the problem is, and don't know how to fix it. I changed a couple of things last time, didn't hear anything, and thought that I had solved it. Months later, you inform me that it is still broken. I'm not even sure that it is Mountain Reader that is causing the problem, as my BBS/provider may be at fault. Am I the only Mountain user left? I seem to recall that Dan D. used it at one time, although I don't think he does now.

Does anybody use M_QWK118? I used it for a short time before buying Mountain Reader, and I suppose I could go back to it, if it would abate this nuisance. Are there other suggestions?

I suppose that I could be spending my time learning Okami, but, to tell you the truth, I am working diligently at learning some other programs, and don't know where I'll find the time. From what I gather, one doesn't just copy Okami into one's disk drive and run it.

Could you please tell me what the problem with Mountain is? Does it cause the newsgroup people a lot of grief? I cannot see it from here, and if it is so bad that it requires fixing before I can post again, my only real option is to shut up. That won't make me happy, as reading and posting to this newsgroup is one of my favorite forms of relaxation.

What do the header reference lines do for you, anyway?

I will send this same message out via m_qwk118 (if I can make it work), and you could compare the two to see whether either one meets the standards. If neither one does, maybe it is my provider.

> >ported Unix stuff and MiNTnet native apps.
>
> Could you refresh my memory and tell me what a client is?

It's a program you use, which talks to the net through the TCP/IP stack.
Think in terms of layers:

Client: CAB with STiK OVL
Stack: STiK or StinG

Client: CAB with STiK OVL
Translation layer: GlueSTiK
Stack: MiNTnet

Client: CAB with MiNTnet OVL
Stack: MiNTnet

Client: CAB with I-Connect OVL
Stack: I-Connect

Normally you'd use clients for the appropriate stack, as the difference is
the interface between the client program and the stack itself, ie the way
the two layers communicate. CAB is unusual in that it supports most stacks
with alternative overlays. GlueSTiK lets STiK clients work with MiNTnet:
the clients see a STiK-type interface and work normally, there is just a
simultaneous translation going on.

Other examples of client programs:

NEWSie (mail, news, FTP and rudimentary web rolled into one)
POPwatch (mail, for use with offline reader)

NEWSwatch (news, for use with offline reader)
TVT102 (telnet)
aFTP (FTP)

> >either went the STinG route or installed full-blown MiNTnet.
>
> It sounds like you're implying that PPPkit didn't support PPP. True?

Nope: it supported it. At the time, STiK was SLIP-only and the only PPP option was MiNTnet. Most MiNTnet users were using full Unix-like setups with Minix partitions etc etc. PPPkit provided a cut-down version which provided the bare minimum for MiNTnet PPP connections using a standard TOS filesystem. You couldn't use most MiNTnet clients ported from Unix, as the clients needed the full Unix setup. However, with GlueSTiK, you could use STiK clients with PPPkit.

IIRC, it didn't work at all for some people and was generally regarded as problematic. Once STinG came on the scene with PPP support it ceased to have any real purpose: if you were going to use STiK clients anyway, you just used STinG. If you wanted the Unix stuff you installed a full Unix setup.

> STinG - TCP/IP stack that handles PPP protocols.

It does SLIP too if you want it.

> MiNT - multitasking Kernal. Does this need N.AES as it needs MiNT?

Nope. You can run MiNT with:

1) A text-only interface (can't use GEM programs).

2) The original SingleTOS AES (can't multitask GEM programs - ie only one at a time, but can multitask lots of TOS programs at the same time as the one GEM program).

3) A multitasking AES (can multitask multiple GEM programs and TOS programs at once). Suitable AESs are Multitos (AES 4.0), AES 4.1 (the last Atari version which was never officially completed and released), Geneva and N.AES (which is supposed to be the best option).

4) X (which gives you a Unix GUI - no GEM at all, runs very slowly on an ST and leaves next to no RAM on a 4meg machine - I think the X port is monochrome only, too).

> MinixFS - The Minix File System, MiNT needed (I'm not sure why).

Nothing else has suitable drivers, only MiNT and Minix itself.

> PPPkit - Everything you need to get on the internet. Still a bit
> confused about what it can and can't do.

See other message, but it's just a cut-down MiNTnet stack, so not "everything you need".

You may be getting it mixed up with the early "WWW" distributions which initially contained STiK and CAB, later several other STiK clients too. It got to be too big so the all-in-one distibution was abandoned and you just downloaded the bits you wanted.

> N.AES - a new AES replacement. Not free? MiNT needs this and
> this needs MiNT?

See above: it needs MiNT, MiNT doesn't need it.

> MT-Newswatcher - Newsreader?

New one on me.

> Newswatch - Same newsreader?

Nope, don't think it's changed its name. It's a news client for STiK/STinG which downloads/uploads in a couple of formats for use with a range of offline readers such as Oasis1, Oasis2, Snews and Okami. It's not a newsreader in itself.

> Several additions:
>
> Vfat - changes the type of FAT table on the hard drive. What does
> this run under? Obviously a other-than-tos partitioin would
> be needed, right? Would that be Minixfs?

Available under MagiC since v4 (?) and MiNT in latest versions (not sure of numberings). Principle use is to get long filenames. It does this in the same way as Windows, the idea being that you can use them on a "normal" 8+3 TOS partition: programs and OSs which don't understand long filenames just see the 8+3 version, so you can still use the partition under TOS. It's more an alternative to Minixfs: long filenames with backwards compatibility. However, it's innately a compromise so not much loved by Minixfs fans.

> XaAES - another AES. Free? Only runs/needed under Mint?

Yes on both counts.

> MiNTXFS - Mint has a file system of its own?
> CDRomXFS - another File system?

This is connected with the way both MiNT and MagiC can have plug-in extra filesytems. I think XFS is the interface (the actual files have an XFS extender, IIRC) and it means eXtended File System.

The two OSs' interfaces aren't compatible: IIRC the MagiC author didn't like the way that MiNT's XFS system wasn't re-entrant, though heaven knows what this means. Something to do with not being able to do background disc accesses, I *think*.

> Draconis - some kind of program

Yet another TCP/IP stack, not compatible with any other. It has its own clients, a browser called The Light of Adamas (!) and an email client called Marathon, last time I looked. Was going to go commercial and be bundled with the Milan, though I'm not sure if that happened in the end.

> Infiltra - ditto.

Email client for STiK/STinG.

> Popwatch - ?

Companion program to NEWSwatch. Transports/filters email via STiK/STinG for use with an offline reader such as Oasis (1 or 2) or Okami.

> PopGem - ?

Similar idea to POPwatch but for MiNTnet, I think.

: I have an Eclipse mouse for the ST and it's giving me problems.

Might be a long shot, but some of the older balls might be perishing due to age ?

Another problem was the compound in "ancient" mice, in these the rubber was so hard it needed to be warmed up before they worked properly.

In either case I'd try another ball in the same shell.

With the debate on ST usage going on I've dug out this old game for my STFM.

Name - KULT
Released by - EXXOS
Released - 1989

Can anyone help out with a walkthrough ?

I've already tried searching the net for the programmers and software co.
but there wasn't anything found which helps with the game.

TIA.

Scott

264. SM124 to PC VGA ???

Errm... I think you mean Minixfs, ie a Minix file system (Minix is a
totally separate OS). The other Unix stuff which comes with a MiNT
distribution isn't Minix.

> or a GUI (graphic user interface) to work with a mouse and menu's and all

The Unix stuff and GUI aren't mutually exclusive, ie you can have both at
the same time, and use TOSWIN to put shells and text stuff in GEM windows.

> >MinixFS - The Minix File System, MiNT needed (I'm not sure why).
>
> Minix is based on Mint. It needs a kernel, like Linux, NetBSD (other unix

> clones).

Minix is a separate OS, not based on MiNT. MiNT has drivers for using a
Minix *file system*, as does Minix itself. Possibly also Linux68k: I have a
recollection of someone mentioning it here a while back but can't remember
if it was still at the concept stage or a reality.

> Seems to be the
> opposite with WIN98, where VFAT's are said to be using diskspace more
> effectively.

You're confusing VFAT with FAT32, which came in with late-model Win95 and
is standard in Win98. VFAT is to do with how filenames are stored AIUI,
hence long filenames etc. FAT32 is a development of the earlier FAT16 DOS
filesystem which uses smaller sectors so you don't end up wasting so much
space when storing lots of small files. Same thing as selecting
sector/cluster size with TOS HDs (a bit like the difference between GEM and
BGM partitions I think), though it's big news on PCs...

> such attempt?).

I think you might be confusing it with two other attempts!

There is/was an OS (disc based) called Oases which used to be called OMEN:
it was supposed to be being developed as a cross-platform OS for all 68k
machines including Apple and Amiga, and wasn't TOS compatible. Don't know
if it's still current, but the name is close enough for confusion.

There was also a cartridge based OS called SMS3 which was even more obscure
and Atari-only. I assume it's died the death by now, but you never know!

AFAIK Dolmen is a new OS which is supposed to be TOS compatible, rather
than a modified TOS.

I made it, but according to always lower prices of new monitors it is not recommended.
Picture quality is not quite good, resulution is only 640*480, (eventually 800*600), no size regulation possible without opening case etc.
If you have newer video card, problem will be too high refresh frequency.
Converter is probably not available, so it requires modifications in SM124 itself.

Btw. using mono VGA monitor on ST is much simpler, you need only couple resistors and connectors.

Hi Satcom, well I did some time ago a collection of my icons, for THING.
You can fetch those from my www page.
http://kellis.atari.org

and I made a full collection also of ST palette 16 col backgrounds.
I put those on ftp.funet.fi .
I am almost done with a new set of icon for THING. Will soon release them.
Quite a lot of work to keep same design, sort everything out and make some
new ones with quality..
I will post the news here..But meanwhile, you can get the old ones, which
are not that bad for a starter anyway.

On Sat, 2 Jan 1999, Satcom2 wrote:

whoaooo Louis, getting there, learning the HARD side of mint..
And the worst is, you make it sound very easy.. "just add the lines..."
I am impressed, this is highly technical here..
(just to show you that 80% of the things you don't know, or are fighting
with so far are also THAT easy, just need to know them).
:)

> tar.ttp's. For MagiC max size is 32 characters, I set the minix stuff to
> go to 64 chars.
I think THING desktop has a limit of 32chars anyway. So to access those
filename, you need to be from a shell.

> As for a replacement OS: just fine. The bloody problem is the Mintnet
> stuff, I can't get it to work. Read the docs! Did YOU read them? Which
> ones? The Mint.hyp? Try to look into the Mintnet section, see what it
> comes up with on "Mintnet Installation etc"...
hm I thought YOU GOT connected!, what problems do you have?
If it is gluestik that you have a problem, well this is NOT a MiNTnet
problem. And the doc of course relating to this possible problem would be
found in the Gluestik package. Makes sense?
If mintnet gets connected, and if mintnet applications work fine, well
obviously you don't have a problem with MiNTnet, which besides, you got it
to work directly right after you first installed it all. So pretty fast to
use MiNTnet? no?
Now for gluestik, well, just get latest gluestik package, and read the
SMALL doc that comes with it.
AND DO NOT use sting/stik dialer!, this is not how it works.
You make a mintnet connection, (pppd), then the fact that gluestik was
loaded at boottime, you can just directly use the STIK/STING applications
like if you were under STIK/STING.

> Also told him that if by wednesday this stuff ain't running decently, it

> other one...

Magic as far is the internet is concerned is exactly handled like if it
was under singleTOS.
Not the same with MiNTnet, which really ties up with the
kernal/environment/extensions. Magic networking wise is hmmm how can I say
that, "weak".
Just try the mint CAB.OVl, you'll see a difference..
Aftp, working like a charm compared to sting/magic.
All the daemon running perfectly. Getting your mail in background without
you even noticing it. set up apache http daemon. a real ftp daemon. telnet
etc, micq running very very well (always latest version in date).

Well, quite hard to define "basic tasks"
Is Everest for printing considered a basic task?

Rather they should write their
> applications to function happily within whatever environment they find
> themselves in, ie TOS, MagiC etc, but then take advantage of anything extra
> they detect.
So make the application bigger than what it should be.
Everytime reinventing the wheel for every application. have to learn
everything for each basic tasks.
IMO, if a printing routine is like 40 lines of code, to do a SIMPLE, not
featured print out, BUT nvdi offers a call like:
do_printout(printer_type,font,paper_type,color_off_on,text_file)

Be sure that I will be using this 1 call, rather than wasting 4 days
trying to do, debug a simpler printout routine)
So I do not agree with you.
People develop in C, coz of fast development, portability of code and
already existing libs.
If there are some extensions that already provide such nice calls, why not
use them? for people that do not have those extensions?

See, in popgem for example, it plays synced samples (event related), I am
certainly not gonna rewrite a full sample player, when people already
spent years/months of code into making one, good quality), I just call it,
and that's all. A computer environment to me, should be like a puzzle, but
with pieces interchangeable..
Want to write an email?
use the best text editor you have, then pipe it to your sendmail program.
Rather than using a fullblown application that will try to do everything.
More RAM, more disk space, generally doesn't multitask correctl, harder to
fetch the bugs, and the features generally won't suit your tastes.
See, it is all about combining the best tools together.. to create 1 big
one task.

>

It goes all against upgrading, setting things up, Going nowhere in a
long term.

>
> Ideal way of doing things IMHO :-)
Ideal "wrong" way of doing things IMHO.

Sharing the resources is the best way to get the most out of your system.

Protocols have been invented for this exact purpose. And YES, it rocks. Is
a breeze to use the computer, even one dating from 1985.

Denying them is a big mistake, you have NO idea what a 16Mhz motorola and
some RAM available can do as long as it is set correctly. No idea..

On Sun, 3 Jan 1999, Mike wrote:

> Could you refresh my memory and tell me what a client is?
like many protocols, there are 2 ends.
Client & server.

One asking a request, The other doing it.

client , server.

This is a 2 ways things. they talk to each other with a protocol well
defined.

In example:

CAB , httpd (apache, or ncsa or whatever http daemon)
Cab request the content of an address, the server (apache) sends the data
back to CAB, which will display in your GEM window.

Aftp/fiffi/ftp/Duftp , ftpd (ftp daemon).

Other type of client/server: av-protocol.

POPGEM , THING

client , server

POPGEM will ask the server (as defined by AVSERVER var, THING here) to
open a window directory, only showing the *.TXT files. THING if
understood the request by the server will do so and send back to the
client an OK message. Telling POPGEM that it did, and everything went
fine.

Does that clear it up a little?

>
>
> It sounds like you're implying that PPPkit didn't support PPP. True?
PPPkit used the same tools/programs than the one found in mintnet. So it
DID support PPP protocol as the name says ;) "PPPkit" and not "SLIPkit" ;)

Ok, so mintnet was not hard at all to get running. was it?

>
> However, when using Connexion it fails in doing so. Perhaps some missing
> line about a symbolic link in the Mint.cnf???
no, the file that is not seen is quite simple actually:
in your .ppprc file, it says to look for the file $HOME/.chat-script
In which case the $HOME will be wrong depending where you started pppd
from.
Don't forget you are now under a multiuser setup, not singleuser anymore.
A way to handle that is to force the link, and not let chat interpret the
$HOME variable. So:
connect "/usr/etc/chat -v -f $HOME/.chat-script"
into:
connect "/usr/etc/chat -v -f /home/root/.chat-script"
So there is only 1 location really.
If you STILL have a problem, then probaby you didn't read the doc in kemd,
saying that this file should be "chmod"ed , a chmod 600 .chat-script
should be good. (you can also do it from THING desktop)

>

Try this:
remove the ball, with your finger, move manually the 2 rollers. Your mouse
should move correctly, it will allow you to see if it is an electronic
problem, or contact/hardware problem.

The mouse pointer should move correctly, if it does, you have a ball
problem, roller.
If it still doesn't move correctly, then you most likely have a problem
with your cable, (having a short or bad contact), try to shake the cable
around, twist it, and check the mouse pointer again. OR you might have a
bad connection/connector (db9) under keyboard. The best would be to have
another test mouse to try it on. Obviously I take it that you do NOT have
an extra mouse to test the port..
Try that and get back to me.

>If not, can someone tell me what are the tolerences of the resistors marked
R4
>and R8, and where they can be obtained from. Not Maplins, they couldn't
help.
>
>Thanks
>Chris

According to schematic I downloaded R4 is a 330 ohms 2 watt resistor, if it was metal film then it was probably 1%, if Carbom film then it may have been 5% but was probably 10%
R8 is labled as 1 ohm, no power is given. However these vales are for the power supply of a 1040stf thouhg they are probable the same.
In general if it was about 6mm long and 2mm diameter then it is either a 1% 0.6 watt metal film or a 0.25 watt 5% carbon film, if it is bigger than this then it is probably carbon film (twice the size = 1 watt, 4 times the size = 2 watt) in any case I don't think the the tollerance should would be greater than 10%.
If in doubt just get the smallest tollerance you can find.

Hope this helps.
Stephen Moss.

I got Ghostscript 5.10 to run on my Falcon w/ Nemesis, TOS 4.04.

Here's the address for Ghostscript 5.10:

ftp.rz.tu-harburg.de/pub/software/systems/atari/gnu/ghostscript/gemgs

Also, there's an English resource file with some English Docs at:

http://www.cix.co.uk/~derryck/software.htm

"English Documentation and RSC file for Ghostscript 5.10"

(The Cheshunt Computer Club for Atari owners)

Also, there are TWO versions available. One for the 68000, and one for the 68030, which the Falcon and TT use. If it doesn't work at all, try downloading it again. It wouldn't work at all for me, and finally (after much frustration), at someone else's suggestion I downloaded the entire thing again, and Presto!, it worked. :-)

Hope That Helps,

Clayton Murray

Windows on top moves really smooth in real time, not only on my graphics-card but on the standard Videl in 800x600/16 as well. Windows not on top flickers, because the window's contents isn't cached and blitted in this case. I believe this is the case with MagiC as well, so your problem is probably something else.

> don't like propfonts in my AES system, the menu's don't look nice. All the

I agree 100%, proportional AES-fonts are definitely a no-no. It can look cool with the right applications, but there's so many older (and brand new) apps that doesn't handle this that it's more trouble than it's worth.

There's also a large number of apps that doesn't use the correct font in their userdefs, so even non-proportional fonts can cause problems if the AES-font differs a lot (size, w/h ratio) from the VDI system-font.

I used to use a variety of cool AES-fonts, but have settled with a non-proportional 8x16 VDI system-font instead. It might not look as cool as the proportional Monaco-font you see in MagiC6-ads, but it doesn't cause problems with any of my apps.

You're not using 1.15, right? If you read the docs you'll see that under certain circumstances Freedom can't be used (e.g. from a CPX), and the AES will revert to it's built-in fileselector (or other, more conventional replacements like UIS). I don't know if this is the case with Freedom2, since I've never been able to get this working properly with any OS. I've heard the

latest version is better, but apart from the odd problem I'm really happy with 1.15 and will probably stay with it a few more years.

279. STing and V90 speeds

Newsgroup: comp.sys.atari.st
Date: 1999-01-04 00:00:00 UTC
From: aprice@postern.demon.co.uk
Message-ID: <915447142.22704.9.nnrp-11.9e987258@news.demon.co.uk>
Source record: 87021

I am using a USR Sportster Mesage Plus modem, flash-upgraded to V90, with STing. When I log on (Demon Colt), STing reports a connection at 31200, or just occasionally 33600. CAB downloads start at high speed, but rapidly settle down to 3000-3200 bytes/sec. FTP downloads via Newsie run at about 9000-10000 bytes/sec. I have set the speed in HSMODEM to 115.2Kbps.

Given that V90 is 31.2K send, 56.6K receive, just what is it that STing is reporting?

> accesses, I *think*.

This is (mostly) correct, MiNT's current XFS-interface is not re-entrant.
Re-entrance means that the same piece of code can be executed by several
processes or threads simultaneously, which the current XFS-interface doesn't
allow.

Work is in progress to make MiNT reentrant, and AFAIK the new FAT/FAT32/VFAT
filesystem already is. However, unlike I said in another post on csas, this
does *not* mean that the current interface/API will be changed (I
misinterpreted two statements from Frank Naumann, the current kernel
maintainer), full re-entrance is apparently possible with the current API.

...or run a AES on the console and still have virtual consoles. A very handy and flexible setup, it's a pity that the vconsoles doesn't work on graphics-cards. OTOH I can use two monitors simultaneously on my Falcon, a 14" connected to the Videl for the consoles and a 17" connected to the graphics-card for AES :-)

FYI newer MiNT-kernels (1.15.x) also supports FAT32, but you need a harddisk-driver that recognise the FAT32-partitions. AFAIK HD-Driver >= 7.52 is the only one available.

Hi Kathereine,

well, some things are easy, some not (for me, at least)...

>I think THING desktop has a limit of 32chars anyway. So to access those
>filename, you need to be from a shell.

Well, once I got a decent drive with more space I reinstall the Minix on
that one (now it's on a noisy Syquest-44). Maybe I'll opt for the 32 chars
version then.

>hm I thought YOU GOT connected!, what problems do you have?
>If it is gluestik that you have a problem, well this is NOT a MiNTnet

>obviously you don't have a problem with MiNTnet, which besides, you got it
>to work directly right after you first installed it all. So pretty fast to
>use MiNTnet? no?

Actually, I had it working on the 3rd try. .chat-script had a last line
set to my ISP sending out "HELLO", in my Sting dialscript that's set to
"wait for HELLO", "resp HELLO" and it works OK. So I set the last line to
HELLO: HELLO and it didn't go. Next I tried with "HELLO:" only, since I
don't have to transmit HELLO myself, that didn't work either. So changed
again to "HELLO" only and off I went.
The problem WAS that I didn't know how to get it going from under N.AES
and have been asking around but probably not clear enough. Jo-Even finally
came with the right answer. In fact I just needed the "on/off button" to
start the stack working. Use Connexion now, the only thing is now it
reports "can't find the .chat-script". So it starts up and quits again
after 30 secs. Matter of changing some lines in the configs again, as Jo-
Even suggested already.

>Now for gluestik, well, just get latest gluestik package, and read the
>SMALL doc that comes with it.
>AND DO NOT use sting/stik dialer!, this is not how it works.
>You make a mintnet connection, (pppd), then the fact that gluestik was

>loaded at boottime, you can just directly use the STIK/STING applications
>like if you were under STIK/STING.

I think I got the latest, and installed too. It was all the confusion about this Gluestik/STiK thing again too. I put STIK_TSR again in the autofolder (removed it again now, I believe it's not needed), then set up a complete DEFAULT.CFG again with all the lines and I think the only line now needed is ALLOCMEM=100000. I've set it up with Gluestik.prg in the multitos dir, with a line in mint.cnf exec=c:\multitos\gluestik.prg, but I think I can change that by using gluestik.xdd instead and removing the exec line...

>Just try the mint CAB.OVl, you'll see a difference..

Haven't done sofar, although I fetched the latest version. It's all for the final finetuning. First need to get going on the configs again so that .chat-script will be seen.
Jo-Even talking about "hardcoding", ooooppss , here we go again!

Does it work when you simply start pppd directly (not via a script)
from a shell? If so, then you have a problem with either $HOME or
paths in some of pppd's config-files.

Some people use fancy scripts to set up and kill a connection,
Connexion won't work in this case because it starts pppd directly as a
child.

Use absolute instead of relative paths: E.g. '/home/root/.chat-script'
instead of '~/.chat-script'. The latter will actually point to
$HOME/.chat-script which won't be correct if N.AES and your
root-account has different home-directories.

Hello Jo,
No I don't have no prob with $HOME, or anything like that.
As soon as I start connexion, an alert popups up and says, Connexion needs
a multitasking AES, Then exits :)
So it must be checking some AES features, or aes versions, or whatever
that it fails to recognize my naes 1.2 :)
Andyes, it doesn't matter coz I start pppd and disconnect from Your
WONDERFUL Taskbar (start menu). So that ain't no problem.

Louis, btw, don't use Speedup program, and multistrip.
They come with naes package, but they will eat up all your CPU cycles..
Use Jo even Taskbar (2.5), freeware and the best. about 40 times better
than appline, or multistrip with SMU.

stik_tsr should not be used, Non of the stik or sting tools are needed,
all you need is the 2 prog of gluestik, 1 conf file then the clients you
want to use.

gluestik.xdd and gsresolv.prg both in your multitos folder.
in your mint.cnf, add the line exec c:/multitos/gsresolv.prg
create a folder called stik_cfg in your boot partition (C?)
and put the file default.cfg in there, which should at least contain
ALLOCMEM = whatever size.

Then reboot. You should be all set.
once you start pppd (with connexion for example). you can directly use the
stik applications.. AND the mintnet ones of course at the same time..

Exxos later became Cryo. You could try them, but I doubt they'll have any
help for the older stuff.

>problem, as my BBS/provider may be at fault.

As you are obviously posting via a BBS gateway(?) your reader can't do
any threading at all. I don't think that the BBS software can
"simulate" the reference lines in the header ither.

>Could you please tell me what the problem with Mountain is? Does it
>cause the newsgroup people a lot of grief? I cannot see it from
>here, and if it is so bad that it requires fixing before I can post
>again, my only real option is to shut up. That won't make me happy,

Does no real harm at all! Any decent newsreader will put your messages
sorted next to the properly threaded ones anyway. Maybe Peter's reader
includes "Re: " when sorting making your posts appear in wrong
positions? If so a good reason for him to try Okami+Newswatch and maybe
even try to set up Sting? :-)

>What do the header reference lines do for you, anyway?

They provide an easy way to read posts in "logical order" be giving the
message ID:s for the messages you follow up to. If missing you will
often read the "answer" before the "question", that's all.

<>
<>--
<>Misha O'Neill
<><misha.oneill@zetnet.co.uk>

I tried Misha's suggestion ie. INIT=AT&F2L3W2311=50 and it bombed out. I then tried Derryk's suggestion to leave the baud rate at 19200 and still with the above INIT setting..... Bingo the modem fired off at twice its normal volume and dialled out at twice the speed. It took me by suprise I hardly noticed the DCE speed which came and went in a flash, I think it was 26k4.

So my thanks to you guys for all your helpful suggestions, how anyone can say there's not much for the ST user in this group, I find hard to understand.

I was beginning to have serious doubts about my capabilites with a soldering iron with having taken so long to get the upgrade working. I'll have to test my other ST now.

Re further mods to this upgrade to 57k6 and 115k2 would I benefit from this with a 28.8 modem? Just a thought.

Thanks again
Mike

If you've got a PC emulator, get the latest PC version (I forget the number) -
it has the color icons standardized with the ST version.
I'm surprised the Mac version doesn't, yet. Keep lookin'.

308. [Ann]: Login v0.16 Beta

Newsgroup: comp.sys.atari.st
Date: 1999-01-05 00:00:00 UTC
From: quantum@voicenet.com
Message-ID: <VQuk2.1495$7P2.13684951@news2.voicenet.com>
Source record: 86850

Yet another version of Login, the program that allows Atari users the same multi-user configurations of Windows. Create up to 25 different user accounts each with their own NEWDESK.INF, CONTROL.INF, Auto files, CPX files, and Desktop Accessories. Great for multiple users of the same computer, or for running programs that don't like certain Auto files or Desk Accessories by simply creating a new account. For the latest update see,

http://www.voicenet.com/~quantum/login.zip

Or, to read the READ_ME file first, see,

http://www.voicenet.com/~quantum/read_me.txt

Here's a snippet from the History file, and of course, if there are any questions or concerns feel free to drop me a line...

January 3, 1999: Version 0.15 Beta
o Added 'Change Password' routine to SETUP.TOS. Allows you to change the password of the user currently logged in, or enter another username to change their password (of course, verification of the original password is required, and all attempts and changes are logged).

January 5, 1999: Version 0.16 Beta
o Password file and USER.BIN are now binary, NOT text. This is a very good thing :)
o If LOGOFF.PRG detects that the times of NEWDESK.INF or CONTROL.INF are different then that of USER.BIN (created when you login) then it assumes that you've made changes and asks if you wish to save those changes to your account before shutting down. Again, this could also be done via the Update function is LOGOFF, but at least now this gives Shutdown something to do. Note, if you've made changes to your AUTO or CPX files it does NOT (yet) detect that (but eventually it will).

If you can use a dedicated scoring package I recommend Proscore. I
am the author and it can be downloaded from my website:

http://www.pressenter.com/~tkelly/

Proscore even has support for NIFF (although it still needs
development). It does need a mono monitor on an ST and a GDOS that
supports truetype fonts.

Don't use Geneva/Neodesk/MiNT. We both now it's rather instable and above
all slow. If you really want to stay with MiNTnet use N.AES/freeMiNT 1.15.
It's stable, very quick (as quick as MagiC). Support of VFAT, FAT32 etc..
>
>>Sure nothing is perfect, only one is worser then the other.

I don't need to go to that site to know what you means. I've the demo of
Wensuite 3 here with me. Previous version had graphic card support. This
seems to be gone. Very ugly picture. However the time I've tested it I
didn't had any crash which I can't say of Adamas. Crashes all the time. I
ordered an update of Adamas. I hope it will work better now. The latest
demo looks promishing though. Still crashes but not so often.
Adamas is really fast when it becomes to display pictures.

There's also another option. I personally use the
TRASH.PRG/TRASH.CPX freeware program. It requires the Extended Control
Panel, and probably a hard drive too (at least it would help). It's more
like Win95's (or whoever MS stole it off of) Recycle Bin. It does not
delete files, rather, it moves them to a folder you set up. Therefore
if you erase something in error, it's in this folder and can be simply
copied back.

Hope that helps,
George

: Dear Atarians

: I'm using a 1040STE with TOS 2.06; no internal clock. I have an
: Eureka clock plugged into the cartridge port. It won't go beyond 1999.
: I need an ACC or PRG that will take me into the new millenium. I've
: tried CONTROL.ACC, SETTIME.PRG, CLOCKSET.PRG, MCLOCK.ACC, DCCLK33.PRG,
: DATIME.PRG, AUTODATE.PRG, and CALENDAR.CPX. All use 2 digits only.

Somebody out there correct me if I'm wrong, but Ataris should be
okay until 2020 or so, even if it only *shows* the last two digits of the
year. So unless there's some reason to see the first two digits, your
computer shouldn't have any millenium bug :) Now, some programs only use
2 digits, which could be a problem, but the OS is fine (especially Tos
2.06). If, however, Eureka clock (which I've never seen) is not Y2K
compatable, and your 1040Ste is on the 'Net, you might benefit from a
program (I forget the name) that checks time servers for the current time
and automatically sets your clock. It's available from Peter
Rottengatter's home page (author of STinG. For the link (I can't
remember it now) see http://www.voicenet.com/~quantum/links.html).

Good luck,
George

Glad to hear it.

The only thing to be aware of is I was talking to one of the UK
distributors who confirmed that a number of the supplied software
items are still in German (though apparently some have bene
translated). Whether N.AES is included in this category or not is
another matter, but wasn't there an English RSC file for N.AES
floating about?

At fear of being accused of pedantry it was called SMS2 and was a
development of the Sinclair QL's OS.

It looked very interesting but a little difficult to get to grips with
(this from a man who's worked with IBM mainframes running MVS/XA and
ICL's running VME :-)

My copy is down my shed somewhere along with the STFM (and OS9)

>Aren't you using the NEWSwatch Okami way of life Louis? ;-)

Hi Bram,

sure. But I still use Newsie for online reading groups, most of them
binaries. I still think it's great there. It was said this limit on full
newsgroups was lifted from v. 0.92, and with me that appears to be true.
For everything else I use Okami, though I'm anxiously waiting for this
aMail stuff. Still not out, I discovered 5 mins ago :-(
Got some problems using Popwatch on Mintnet. Sending an email went OK
earlier this evening and just also 5 mins ago it fetched one too for the
first time. Thusfar it bluntly refused to do so, read my previous postings.
Haven't got a clue what that could be.

Depends if you want to use a GEM shell or the command-line. If you're wanting to use a GEM shell, to save having to use command-line switches, you'll need to hunt around a few FTP sites for a program called PGPSHELL. That will let you generate keys, maintain your keyrings, as well as encrypt and decrypt files or text.

To use the command-line, double-click on PGP.TTP and pass '-kg' as the parameter. Then you can just follow the prompts.

One thing to note is that PGPSHELL and Magic don't get on, or not on my system. I usually end up with a system crash with part-built dialogs, so if I need to use it I drop back to TOS. Other than that, it's quick and easy to use.

If you can't find it, mail me and I'll hunt out my copy of the archive for you.

Yes ;-) (check the URL in my sig...)

I'm also working on a 100% GEM-based configuration-utility for N.AES,
it sort of works already but need some bug-fixing and cosmethic
improvements. It's in english and a english hypertext will be
included.

I had a look at the very new v1.5 package. Animated GIFs are damned slow
to decode the first time. Some crashes with Magic, better behaviour with
single Tos. I dislike its dittering in 16 colors: far from what you can
see with Cab, still the best for me.

Bye,
/Pascal/

With US Robotics that I flashed upgraded to V90 specs I typically get rates of 46.6K to 49.8K with my ISP. Prior to the US Robotics modem I had generic 28.8 that would only report the DTE rate. I have to agree with Terry that the DCE info is much more usefull, espically when using the new 56K lines. If there is excess noise at the time of connection the rates can drop down to 28.8 or even 24 or so. Aborting that connection and retrying a few seconds later will normally restore the speed. At least this is true for me with GTE here in Los Angeles :)

I touched base with Godfather's Computer, the other U.S. outfit that was
going to deal in the Milan, and they said they could not get any answers
out of Milan, so they weren't going to deal.

Seems to me that shipping motherboards from Germany and putting them into
systems in the States has GOT to be cheaper than shipping entire systems.

Please note that I'm talking about 1.15 now, as I've never been able
to get Freedom2 working.

There are two main problems with Freedom (1.15):

1. After a certain number of calls it just ceases to work, and the
original fileselector is used instead.
2. Under some circumstances (e.g. when called from a CPX) it's not
possible for Freedom to open it's window.

>that rate to 38400 without anything needing to be adjusted.

That's how the 4040 mod works here. The port speed on my STE is set as
19200, although the modem used to say it was 38400, or 57600 when I
forgot to switch back to the lower speed.

>It should be possible to set the modem to report the serial port speed (DTE)
>rather than the connect speed which should prove the mod.

If there's no init string sent to the modem by the dialer, adding "ATW0"
should make the modem report the DTE (port to modem) speed, whereas adding
"ATW2" should make the modem report the DCE (modem to modem) speed.

If there is an init string, just tag on "W0" or "W2" depending on what you
want the dialer to display.

BTW, this works with my 14400 and 33600 Rockwell modems, and my 28800 Pace,
so it should work with any other Hayes compatable modem.

Hi Chris, get "ST-TOOLS". It'll do the job for you just fine (although
its slow on big files on floppy disks). That is, as long as you've not
copied anything to wherever your files are. Then, they might have been
overwritten, and lost...

335. ST-Guide trouble

Newsgroup: comp.sys.atari.st
Date: 1999-01-05 00:00:00 UTC
From: bataille@xs4all.nl
Message-ID: <76rssmild1@news2.xs4all.nl>
Source record: 86900

Hello,
I can't get ST-Guide to work well. It loads from an ACCS folder
(under Magic 5.04) and always tries to find the HYP in that same
folder. I have set a path for these HYP-files in STGUIDE.INF but that
clearly has no effect. If another program calls ST-Guide things go
wrong in the same way. Any help would be appreciated, thanks, Joost.

Joost Bataille email: bataille@xs4all.nl

336. Re: Milan - what would win it for me.

Newsgroup: comp.sys.atari.st
Date: 1999-01-05 00:00:00 UTC
From: dennis.vermeire@ping.be
Message-ID: <76s1lsfmt1@news3.Belgium.EU.net>
Source record: 86901

Hello,

Their seems to be some confusion about the Milan motherboard-kit:

The motherboard-kit comes in a nice big box and includes:
- Milan-Mainboard with 68040 25Mhz fitted
- Graphic Card S3 V64+
- Drivers
- Milan-Multi-OS 1.25 CD
- Cables for internal connection to IDE, Floppy, serial and printer port
- Manual
Suggested retail price DM999 or ï¿½325

Their is only one version available and this is it !!, the definition of MOTHERBOARD seems to be different to Milan Computer then is does to most of us. Considering the high retail price it seems to me, one is better off bying the cheepest assembled version and start building up from there.
I gues the reason why most dealers don't like to sell the kit on its own is because the Milan is a nice machine to get rid from all their unsold and out of dated material (small IDE harddisk, 2 4MB SIMM's, 16 speed IDE CD ROM), they've got hungry kids to feed you know....

According to an advertisement from Milan Computer in the German ST-Computer magazine, the SCSI-card is now for sale (DM199 or ï¿½70). They also mention an 68080-UPGRADE wich should be available now (DM999 or ï¿½325). They DO NOT mention a MILAN060 so don't get confused.

ASH is a commercial firm, why should they release MAGIC for the Milan, when EVERY Milan owner gets NAES for free. I can't imagine they would sell a lot of copies. Milan Computer has chosen the NAES-route, if you don't like it well one of the options is the HADES060 wich come to think of it, could be a better and also cheaper buy in the end.

You want some more to think about? According to a couple of benchmarks I made with gembench 4.0, a TT with Cattamaran fitted (48Mhz) and a SuperNova graphic card wins on the display (+ 325%) while on speed the Milan is only nearly twice as fast (+ 189%). But most important, while working with it I never got the impression that it was the superior machine. When you upgrade from a standard ST or Falcon the speed factor will be quit impressive, but if you are a Atari user wich has upgraded his gear through the years to something like the configuration mentioned above the Milan might come as a disappointment. If anyone is interested in the benchmarks I'll be glad to post them.
The only thing going for the Milan IMHO is the price, but to turn it into a full spec HADES will cost you much more.....and you still will not be able to run MagiC.

I don't know if the Milan is selling well, but I haven't seen any Milan-users in the newsgroups or WWW. Perhaps they can't get on the net with the supplied Draconis package?

Cheers from Belgium

340. Running NetHack on a Mac

Newsgroup: comp.sys.atari.st
Date: 1999-01-05 00:00:00 UTC
From: xav@compsoc.man.ac.uk
Message-ID: <76sc5r$8vd$1@irk.zetnet.co.uk>
Source record: 86905

My Falcon has been debilitated by a failed Nemesis installation for some time now, so to get over my Atari withdrawal, I bought MagicMac. The one program I really miss, though, is Warwick Allison's (sp?) GEM version of NetHack 3.1.

Has anyone got this to run under MagiC(Mac)? Is there a patched version? Are there any alternative ways of running it?

At work it runs flawlessly under Gemulator on a PC. My best effort on the Mac involved running RealPC (a PC emulator), then running TOSBOX. NetHack runs like this, but it's sluggish.

NoSTalgia seems to be another alternative, but I'm not aware of any programs to run it at a higher resolution. The 640*400*16 res in the latest version runs NetHack, but with screen corruption around the all-important status information windows.

So does anyone have any good ideas about the best way to get NetHack running at a reasonable speed? My system is MacOS 8.1, with a 604e uP. Oh, and the only native Mac version of NH I found was a direct port of the text based version; I like my colour icons.

I don't know exactly about .hqx decoders on Atari platform (but have heard there is such software). If you have or can access a PC than there is marvellous freeware decompressor Aladdin Expander which handles almost all PC and Macintosh encoding & compression methods. It can be downloaded from <http://www.aladdinsys.com>. BTW this company also makes most popular Macintosh compression tool Stuffit.

Hope this helps.

It's an Atari RGB monitor (more like a TV than a VGA monitor), designed
for the Atari ST, but that can be adapted to be used with other
machines. It can display up to 640x200 at 50/60Hz. No good for a PC, but
useable for video or with a console if you made an adapter.

I have a Mitsumi, and it fits perfectly well. The only problem is mine
has no jumpers.

I'll be making up a text file about how to adapt it. There is a
solderpad on the drive's PCB labelled SD1 or something (I'll check that)
that you have to short to change the drive ID.

Don't bother about inverting lines in the cable, that's for PCs and
doesn't work on Ataris. Just plug in the cable upside down.

To cure the media change problem, use fmc.prg in your AUTO folder,
available in the Quick FAQ.

TB> Mac, but I think later versions or SIT packer can handle them.

Well, not quite. The .hqx extension indicates that the file has been
converted to ASCII characters for internet transmission, and is, in
fact, the same as Bin-hex, or Mode 32, or Mime encoding. Use ESSCODE
to decode. Once the file is converted back into its binary form, it
is probably a compressed file and will have either a .sit or .sea
extension. These are compressed with the Mac program StuffIt, but can
be expanded on the Atari with the program "UNSITX", which I believe I
found on the UMich archive many moons ago.

TB> The Mac has a different standard for executables than most other
TB> machines. The files are divided into two parts, one resource part and

TB> execs on other machines..

Yes, you need to work on the Data part of the file, but you can safely
ignore the Resource Fork, which shows up on an Atari as being a
sub-folder in the same directory as the data file.

Is stguide.inf in the root of your bootdrive? IIRC ST-Guide always looks for
<bootdrive>:\stguide.inf, and not in the current directory.

>alive.

MagiC 2, 3, 4, 5 and 6.0 can be burned in ROM, their is even room left
for the SCSI-driver CHBD. When you boot up, their is a nice rotating
MagiC logo, by pressing different functions keys you can choose the way
MagiC boots: in fast Ram or normal Ram, with scsi-driver installed or not.
Boot from normal TOS if in one is available, set the HD-delay, set clock ....etc.
The settings are saved into the non-volatile memory of the clock if one
is installed. So next time you want to impress your friends think about
this: a machine with TWO operating systems in ROM, incorporating a
full spec SCSI driver....

Hello

I've got a floppy with some important and unfortunately deleted files.

Is there an ST versionof the DOS utility Undelete with which I can rescue them?

Thanks
Chris Lloyd

Great stuff. I've posted my question again. For some reason it took ages for my first post to appear.

Thsi ST-Tools of which you speak. Where can I get it? Is it a shareware job or is money involved?

Chris Lloyd

Hi ST users,

I'm doing a tribute site to a bunch of demo coders who turned games programmers and wrote games that (at the time) really pushed the limits of their machines.

The company was called "Thalion", and they did the following games :

AmberStar*
AmberMoon
LionHeart*
Lethal XS
Atomix
Chambers Of Shaolin
Dragon Flight
Enchanted Lands
Ghost Battle
Seven Gates of Jambala
Leavin' Teramis
Magic Line
No Second Prize
Prehistoric Tale
Tangram
Trex Warrior
Warp
Wings of Death

I'm trying to get hold of copies of these games (Or at least scans of the box covers). I understand there were german and english versions of each game (I'm after both).

If you have any of these games, email me and we'll come to some arrangement.

If you used to work at Thalion, and have some photos or stories or whatever get in touch (Especially if you still have some code/gfx lying around on disks!!)

Cheers

Alex Holland

P.s. To see what Im talking about go to the preview site

If a new mouse pad does not help you can check the idler wheel. This is
the spring loaded wheel that is at approx. a 45 degree angle to the main
movement wheels and keeps the ball pushed against them. If it does not
move in and out easily or the spring has lost tension it can also cause
this problem.

365. Atari Times - still alive!

Newsgroup: comp.sys.atari.st
Date: 1999-01-05 00:00:00 UTC
From: Colin Polonowski <polonowski@zetnet.co.uk>
Message-ID: <76tm3h$9ia$1@irk.zetnet.co.uk>
Source record: 86930

Hi everyone...

The Atari Times is NOT dead!

I was unhappy about letting the Atari Times disappear completely from the Atari scene so I have decided that instead of abandoning it, I will continue to edit it albeit in a different format...

AT is no longer a disk magazine, but rather an on-line publication... The URL for the new 'Atari Times Online' is:

http://at.atari.org

It is my plan to update the ATO pages fairly regularly with the same sorts of articles and news that have made the disk magazine a success over the last two and a half years! I also plan to release an occasional printed Atari Times Special Edition similar to that which I released last year. This will contain a selection of the best articles from the web page along with a few SE exclusive artices in the more convenient printed format.

Atari Times Special Edition 2 is due for release in mid February, and is based on the 1998 Atari Times Awards. It will include reviews of winning software, and interviews with the winners...

I still need your support, and all submissions will be gratefully recieved...

ATO is due for launch on 1st February 1999, so please contact me as soon as possible if you are able to help in any way...

Cheers,

>taken care of via a different route.
>
>Rgds, Derryck
>

Yes, I`m using ASH Emailer v. 1.1, and is very pleased with it.
It`s very easy to use offline, if set up the right way, I run Emailer,
Emailer start Iconn,- connect to the net,- get my mail and news and
disconnect.
It let`s me do other things while getting mail and news and it waith for
me untill I`m ready for the news.

You can tailor it to just getting news or mail, it has a filter option and
it lets you save any messg. into any groupfolder you have created.
Don`t know if there is a limit to how many folders it can handle.

It`s a little slow when doing a search in a large group file, mine is
+ 34000 groups.

cheers

In the Mac side use Stuffit.

There is one. Take a look at the Belgian ftp-site
193.190.205.13 atari/incoming/packers/xbin.ttp

It's a small utility with unfortunately no docs. Just drag and drop the file
you want to extract to xbin.ttp.

Newsie take care of decoding attached mails by itself. At least that is
what happens on my system. I remember me however this wasn't always the
case. In the past Newsie bombed me out when I tried to decode base64
message. Not with UUdecode message however.
I'm not a Newsie user. I really can't say with which version I
had problems.

Try the latest one v2.05. This should work. But don't touch the
cpx-function. It does some very strange thing, at least this is what
happens on my machines. For instance under 256 color mode it will reset
the colors. Trying to view all the files instead of just the cpx's kills
freedom with an Illigal instruction message. If this happens check the
system time. Very likely I will be a very strange value, like 45.03.2038.
>

> Okay, is that a hard number or does it vary? I'm running Freedom from
> my NAES.CFG file (not CPX or ACC). Thanks for the info! ;-)

Someone meantioned that this happened after one has called 62 message. I
didn't count the calls but the bug is there alright.
BTW: With 2.05 I haven't had this for the moment.

Hi Chris. Get ST-TOOLS. Its a tad bit slow on floppy disks, but it works well-as long as you've not copied anything on to the floppy since you undeleted the file. ST-TOOLS is shareware, so you can find it at all the good ftp sites or a local BBS... ;-)

Hey. ST-TOOLS is shareware, but its fully useable, nothing is disabled.
You can find it at any good ftp site, or a local BBS. I also think it
was on an ST-Format cover disk at one point. Should be on any of the
CD-ROM(s) for Atari's as well (Gemini, Mega Archives, etc,...) ;-)

making your one and only key has nothing to do with Okami.
It is an autonomic function of PGP.
How to do it: I did it once and before that I had to read the big
manual that came with the PGP version 2.
Logically there should also be a manual with the 5.x versions.

From: ad329@james.hwcn.org
Message-ID: <76to80$1vm@james.hwcn.org>
Source record: 86939

Well I finally figured out what the true problem with the mouse was. No
gook on the rollers, washed the mousepad and that helped a little, but
the true problem wasn't discovered until I opened the mouse and watched it
in action.

Because the left/right roller is on the right side of the mouse, when you
move the mouse right, it is forcing the ball away from the roller.
It just wasn't making enough contact with the roller to do it's job.
The mouseball sits in a little black plastic housing inside the mouse
that is held down with 2 screws, I loosened the screws then pushed the
housing as far up and to the right as possible and then tightened the
screws again. Now the ball makes even, firm contact with both the up/down
and left/right rollers. No more mysterious left only movement.

Now that I've got the Eclipse mouse properly working I must say it's a huge
improvement over the Atari mouse.

Maybe I'll buy it at the next Neuss Atari Show ... maybe I will go back to MiNTnet/Geneva/Neodesk trilogy soon ... :) maybe I could totally go away from computers as I did with the net a few weeks ago ... maybe ...

>Sure nothing is perfect, only one is worser then the other.

I absolutely MUST ADMIT that MiNTnet is the best while talking about internet connections ... you surely know I have already tried this horrible WenSuite and NEVER succeeded to connect ... above all this internet package is really a shame from its authors ... let's try the latest beta version and you'll see what I'm talking about ... crash and crash my little boy ... They even don't support their users ... just look at their web site and you'll see what I'm talking about ...

STing is nice because you don't need to know too much about configurations and so ... but it has some very big limits while talking about ftp usage (particulary uploading files ...)

When I come to your "overheated room" Martin I also must admit NAES/MiNTnet combination looks pretty good and stable ... I can say I'm lucky enough to live nearest the best atari internet man in our country ..... So, yes, maybe, I'll give a try to your NAES marvell :)

Though, I have not yet tried the genuine ASH internet package with Fiffi and Emailer ... this is surely because all the other excellent related atari net stuff becomes useless under their proprietary connection Iconnect ...
I cannot stay without using aFTP and NEWSwatch and POPwatch and above all OKAMI which is really excellent and the most stable offline mail/news reader in our world ...

I want to add a note here about Geneva/Neodesk support ... did you know that a german Geneva 7 version appeared on the german market ? Dan was announcing to me an english version, but it's already a few weeks ago ... How is it possible that german people have access to a new version ? Are they really more Geneva involved than english one ????? That's a true mystery for me ...

Well, not all of it:

Most stuff runs and runs OK. The real problem ATM is Popwatch: it connects
and disconnects OK, but retrieving is zero. It starts retrieving and then
hangs. Need Multistrip to kick it out, and on several occasions the system
completely locked up next. Newswatch is OK, though the speed seems to be a
little less than with Sting. Rest (as far as tested) was going pretty well.
What could be the Popwatch problem, since the rest runs decent?

I changed the CAB.OVL for CAB 2.5 to the Mint one. Ran OK, but need more
extensive testing before I can say anything more. It probably means I
need another config file to be set in XBoot, the CAB.OVL one, since for
the time being I need the Sting/MagiC setup as well to get my email...:-(
(have to add that the Cab.ovl 1.3011 worked OK with Mintnet too)

Hmm, I wonder if that's possible with Geneva & Neodesk? :)
Any left over space could be used for icons of your choice :)

> this: a machine with TWO operating systems in ROM, incorporating a
> full spec SCSI driver....

Just wondering how this would be possible though, I suppose you'd need an EPROM, and a switcher, and a version of TOS on the ROM because Geneva only replaces the AES.
It'd be good for a laugh anyway :)

AM.

I think therefore I AM.

There spec in english and german. This is a list of standard calls for FDs/HDs (extends gemdos calls ?)

> STinG - TCP/IP stack that handles PPP protocols.

Uses STiK's data structure.

> MinixFS - The Minix File System, MiNT needed (I'm not sure why).

MinixFS is Minix's file system. MiNT is not _needed_ (as you can use this type of partition under Minix), but there is an extension (.xfs) for mint to use minixfs partitions. Unix-like file system

> Reentrant - some kind of operating system feature?

Means that a function can be called by several programs at the same time (multitasking).

>
> MiNTXFS - Mint has a file system of its own?
> CDRomXFS - another File system?
>

MiNT can use several file systems using .xfs drivers.

My understanding was that you had a bit of trouble keeping to a bi-monthly
schedule and it was rumored that revenues were a bit lacking, hence the
guarded optimism stated above. I am very happy to be wrong.

Hmm...thats interesting. I've got MUNPACK.TTP and UUD.TTP in my \WORK
folder in Newsie .92. Docs say that you do not have to use them, and
Newsie will attempt to do it itself (at least with UUencoded files) and
it does this-this is what I've been doing, and saving MIME encoded files
out, then using ESS_Code to convert them.

Odd that these 2 programs cause my system to hang up/and or have to put
Newsie asleep/re-awaken it to get it to respond again, and doesn't do
anyone else this way...

are you sure it's a '260', does it say 260 on the case, has it only got 256k of memory before any upgrades?

If yes then you've quite a rare atari there. Few if any 260 models were sold to the general public the first production model being the 520ST, which had 512k.

trainspotter
jim

ps your best bet for porting these files to PC is if 1st-Word has a save as ASCII or RTF function, save to a 720k PC formatted disk ... assuming your ST has a double sided drive. Early models had single sided 360k drives ... useless!! If not perhaps a benevolent Atari user will do the honours and email them to you ...

Yep, I am well aware of that. It's how I got involved in the first place with the user group scene. I'd hate to count up the hundreds (probably thousands) of miles I've travelled while attempting to aid members. As I said elsewhere recently, it is a community, and we all need to stick together, and not squander our time and effort in a non-productive way.

> Amen to them as well :

Yep, amen to that too

Hello once more,

found a few hiccups, removed some, still got some:

Appearently the Popwatch problems cause has been the presence of TWO MFP.PRG's...
I've been running for a long time with both MFP.PRG and MFP_TT.PRG in my autofolder. Never was a problem actually, so I left it that way.
After removing the MFP.PRG the Popwatch problem has gone away, i.e. now it fetches mail and deletes mail decently.

The problems I'm encountering on running the Mintnet stuff (so that's from pppd) are:

As explained, I use Newsie (0.92) for online reading in binaries groups. Getting the overview, I select the articles one by one, and when an article has been fetched I select "yes" at the "extract file? question". Normally after the extraction I select the next one, and so on.

Running MagiC with Sting it never has been a problem.
Running Mintnet it is: after the first binary has been done, I can select the next article, but it won't get in. In fact Newsie won't do much else then, I have to kick it out using Multistrip. In 50 percent of these cases, the whole system freezes... Not very user-friendly.
The other way is NOT extracting the binaries after the article has arrived but to proceed to the next one straight away: this works OK. The problem then is that I have to manually drag all the textfiles onto UUD or Munpack and it's a lot more work.
Running Sting with Mint, it works about the same way as running from MagiC.

As far as the other clients are concerned, the only difference is aFTP/Mintnet vs. aFTP/Sting: the Mintnet version definitely is a bit faster. All others about the same performance.

I've fetched Taskbar, it sure looks nice, but I think Multistrip (now on v. 1.4 here) offers some features I prefer: setting up the strip vertically (so I can accomodate more apps without the need to scroll), access to all CPX'es, Thing groups etc with folding menu's etc). Not that Taskbar is bad; it's just that MStrip fits better to my needs.

The thing I'm slightly worried about is the fact that here Mint/N.AES frequently freezes/locks up completely on operations in the taskmanager.

I must say that using MagiC, combined with MStrip as well, I n-e-v-e-r had that happening: either the app gave a "69 fault" and vanished from the system or sat frozen, next kicking it out either using MStrip or the MagiC taskmanager and the system itself continued.

Now, this ain't "MagiC is better than Mint/N.AES", it can be (still) a config problem; OTOH, it also explains why I have been very satisfied with MagiC over the years: on my machine it WAS rocksolid.

Finally, on speed: can't really tell which one is faster: they feel/appear to be about the same.

So the decision hasn't been made yet... :-) (and it probably will take a few months at least)

>of QED, a bug or a bug in Magic? Can it be changed? Thanks.

Hi Joost,

first of, clicking the window doesn't activate the program. It just sits
in the background, clicking the window topbar brings it on top again.
Anyway, running MagiC 5.01 here, no probs with QED's menubar. That was
with versions 3.70 up till 4.52 (now). Actually, now I'm working with
Okami, editting the msg so QED jumps in and at this moment QED's menubar
is displayed. In a sec or so I tell it CRL-S and CTL-Q, and the Okami bar
is displayed again.
No clue what could be the problem with you...

Annoying if you want to just shift over. In my case I wanted to keep my
Atari setup too, so I never thought about a cross-platform upgrade. You'd
think it would be possible, but then ASH's upgrade policies seem to be
weirder than weird and presumably SysSol are limited by their agreements
with ASH :-(

It's a major weakness of MagiC for non-German speakers. I guess it would just cost too much/take too much time to translate them: similar to the situation with Uwe Seimet's disk tools package (the name escapes me at the moment).

394. Yippie!!! Unjuiced CSB!!!

Newsgroup: comp.sys.atari.st
Date: 1999-01-06 00:00:00 UTC
From: ad329@james.hwcn.org
Message-ID: <770qkj$2d2@james.hwcn.org>
Source record: 86754

Remember how I was telling you I had juice spilled over a box that contained
my original Dungeon Master, Chaos Strikes Back, and Chaos Strikes Back Untils?

Dungeon Master works fine but the disk door is a little sticky. The Utility
disk wouldn't work, but out of desperation I tried copying it (thinking
perhaps a disk doctor might help) and to my suprise the copy worked.
But CSB was definetly DOA with a blob of sticky juice clearly visable on
the disk surface itself.

Well I was desperate to play some CSB so last night I figured, "What the
heck, I can't make the disk more dead. I'll just do what I do with
non-functioning Atari 2600 carts". So once again out of desperation I pried
open the disk door and took a Q-tip soaked in isopropyl alcohol and as
gently as possible swabbed at the disk until the blob of dry juice was gone.
And guess what..... IT WORKS NOW!!!!

I can't believe that worked. The disk door is still a little sticky
(not as bad as the saved game disks are though) but the game itself works.
Oh joy! Oh bliss! Oh happy day!

Anyways... what is the most amazing "dead disk resurection story" you have?
Up until this the neatest thing I saw was in highschool after we got
a disk drive for the Commodore Pet and one of the students who had beed
eating KFC grabbed the disk by the exposed surface, leaving a greasy thumb
and finger print on the disk. But none of his data was lost and the disk
continued to function. But I think my juiced disks top this one.

395. Since I've been back

Newsgroup: comp.sys.atari.st
Date: 1999-01-06 00:00:00 UTC
From: ad329@james.hwcn.org
Message-ID: <770qkk$2d4@james.hwcn.org>
Source record: 86755

It's been probably more than 2 (maybe even 3) years since I was last a
regular subscriber to this newsgroup. I left because back then 4 out of
every seven posts was someone trying to sell something. Two posts were
about the Falcon or TT, and only one post was actually about the ST.
I found that my local Atari ST BBSs were more useful to me than this
newsgroup. But alas, they are all gone now (although I think that HBO AUG
still runs a BBS) and this newsgroup is my only source of ST information.

I'm back now and the Falcon/TT posts still outnumber the actual ST posts
but it's a hell of a lot less annoying now that all those FS: posts
are gone. How the heck did you guys manage to get rid of all the FS: posts
from this discussion newsgroup? I guess maybe the big flood of FS: posts back
then were from people dumping their Ataris (some of them maybe to buy a
Falcon/Clone, most probably just leaving the system altogether) and now
they've all sold off their possessions leaving behind the true die-hard
Atari Users.

Whatever did it I like this newsgroup a lot more now than I did when I left
it. Even the Falcon/TT posts are a lot more tolerable now.

396. The Top 10 Atari ST Games

Newsgroup: comp.sys.atari.st
Date: 1999-01-06 00:00:00 UTC
From: ad329@james.hwcn.org
Message-ID: <770qkl$2d6@james.hwcn.org>
Source record: 86756

I thought it would be nice to hear what everyone feels were the top 10 Atari ST videogames (hey, we do this sort of stuff all the time on rec.games.video.classic) so I'll start out with my favorite picks.

1) Chaos Strikes Back: Don't you love it when a sequal is on par or better than the original? And the Utility disk was too cool. Although waking up naked in the middle of the dungeon was a little disconcerting. This game falls under the catagory of "Games I stayed up all night playing".

2) Dungeon Master: This one was my first "all nighter". It was the first time I felt completely immersed in a computer RPG. In my mind each character in my party had a well established personality even though nothing like that is ever established in the game. I guess the game had just the right blend of realism but still left room for imagination.

2) Populous: Never played this game over the modem, always wanted to but never had the time. Does this game have cross system modem play compatability (can I play a game on my ST over the modem with a friend who has the PC version?)

3) Out Of This World: Another "all nighter". I loved the simple polygon graphics. In particular I liked the way the first beast was just a big black mass with no detail other than his gapping maw. I've always wanted to hook my ST up to my VCR and record this game from start to finish as a movie. Although I'll probably do it with my Genesis version since it gives a clearer composite image than my ST with Video Key.

4) Frontier (Elite][): This game is great, although some things are kind of annoying. Like, if I've got a ship with 6 guns and a crew of 9, why the hell does the captain have to run around to each gun to fight an enemy ship? C'mon! It's called "deligating authority". Let some of the red-shirts man the guns. And does anyone else get a creepy feeling flying through Wolf 359?

5) Civilization: Another "all nighter". Bow before the might of the Neo-Roman Empire!

6) Lemmings: I wonder how many friendships have ended in the Head-2-Head mode?

7) No Second Prize: Coolest racing game I ever played on the ST. The graphics are pretty simple by today's standards but everything was so fast and so smooth.

8) Guantlet][: never played it with the 4 player adaptor, but my wife and I used to spend entire weekends playing this together... this was before we had kids.

9) Knights Of The Sky: My favorite Flight Battle Simulator. Although it would piss me off when some german ace would challenge you to one on one combat and by the time you got there it seemed like half the german airforce had decided to take you out.

10) A Rock Star Ate My Hamster: Haven't met a musician yet who didn't get a laugh out of this simple little game.

I'm having a hard time limiting myself to just 10 favorites. There are so many more ST games I loved, like OIDS, SunDog, SimCity (they should put me in charge of the city I live in now. I always had the coolest cities on that game), Llamatron, and a gazillion really great arcade ports.

Now on the subject of games that were less than spectacular. These are some games that just didn't make it for me.

1) Bratacus: One of the first ST games I got because it looked like it would be cool. But the graphics blew, and I could never get far in it.

2) Captain Blood: Cool graphics, neat idea, wild special effects but too damn confusing. I never once understood anything and the only alien I ever found was on the planet where I started the game. Maybe if I could decifer the language they were speaking.

3) Haunted House: This game just out and out blows. I was hoping it was going to be an updated version of the Atari 2600 Haunted House. (I always wanted to see that game redone on the ST with fantastic graphics) Boy was I disappointed. Thank Bira Bira it was PD because if I had paid for it I would have screamed for blood.

4) Preditor: I just found this game to be a yawn.

5) Barbarian: Couldn't even come close to solving it until I found a cheat hack for it on a BBS.

Okay gang, your turn. What ST games really turned your crank.

I prefer the taskbar to shrink the names, instead of scrolling. Then
expand them.

> access to all CPX'es, Thing groups etc with folding menu's etc). Not that
> Taskbar is bad; it's just that MStrip fits better to my needs.

Like you need to access CPX every minutes.
Things groups, yes, start applications, Taskbar does that VERY well.
Also has a Start follder for your default application you want to run.
Mstrip takes like 20% of your cpu, or something like that, when taskbar
only takes like 2%, THIS IS VERY important.
taskbar has a better response, and has the capability to hide, kill with
2 different signals the application.
Taskbar has last document feature, (I don't remember if mstrip has that).
And overall it looks better and can be configured the way you want it.
(nice setup program for taskbar).
Font can be changed with drag and drop from THING font selector, hmm
damn there is too much. So it is not a simple looks good taskbar, but
definitaly superior program to appline and multistrip, even for just 1
good reason, the cpu power it only requires. 2% of cpu is a winner.

> Finally, on speed: can't really tell which one is faster: they feel/appear

>
> So the decision hasn't been made yet... :-) (and it probably will take a
> few months at least)

Louis, please when you talk about stacks, refer to the correct one. in
example:
Aftp for mintnet is considered a mintnet application. (hence why you saw
the speed difference)
Now Newsie using Gluestik is NOT a mintnet one.. So refer it as gluestik.
If gluestik is slow, buggy etc, whatever, try to work the gluestik bugs,
not mintnet.

Btw gluestik, you need to try several (normally the absolute latest works very well), but who knows..
anyway, Newsie author develops under magic, so I can bet you that it will at least work better under magic!, makes sense?
However I can tell you that even under magic, hm newsie ain't that (bug wise)
Bye..

Better do your testing with a nulmodem to another computer if you can
(cheaper) - I used my Psion 3A to test gszrz when I couldn't get it to work
first off. That would prove/disprove a software (StiK) problem rather than a
hardware one, where I'd just expect nothing to happen if there was a
problem.

> telephone number. Its looking increasingly like a problem with the
> mod. I'll just have to find some time to go over it with the
> magnifying glass.

I couldn't get my mod to work either TBH! :-((

And I snapped a leg of the chip off flush with the side when I tried to bend
it down to the PCB to solder it back... Luckily I was able to mill down to
find the internal flat section to solder a wire to...

> I'm not sure about setting the modem to report the serial
> port speed, as I said I'm just using ATZ. I'll have to consult the
> manual and experiment a bit.

Judging by the report from STiK that you quoted it's already set, so
hopefully you'll see that go to 38400 once all's OK.

Where did you get the design for the mod from BTW, an old Atari World mag?

Controversial? Moi? :-))

>Thinking about it, I suggested DCE reporting 'cos Mike would have
>already had it reporting DTE (default).

Yes, he does, but I'm afraid that I don't understand your table:

> | Serial upgrade
> | On | Off
> -----+-------+-------
> DTE | 19k2 | 38k4
> DCE | 19k2 | 28k8

For I'd expect the DTE figure to be 38400/19200 BUT the DCE to be the same
(the modem should connect at the highest common speed possible?)

In the final analysis it would be the number of cps that would matter.

>IOW, under DCE the modem will only connect at 19k2 IME.

Not sure what you mean here Misha?

System Solutions here in the UK had "Freekeys", a keyboard case with curly lead to go with the Desktopper case. If Chris is in the UK I'd be prepared to accept an offer for the one I have.

Otherwise, a spare ST case could be sawn down through the groove at the back of the function keys and a back glued on? (not sure if the keyboard PCB projects back more that this.)

>as a modem command in the body of the text and killing the carrier?

You have a too short "guard time" setting in the modem's s-register 12.
Normally defaults to 50. It's measured in 1/50 sec. making 50 = 1 sec.

To check:
Type ats12? followed by [Return] in any terminal program. The modem
should answer 050 followed by OK.

To set:
Type atz [Return] to reset modem.
Type ats12=50 [Return] to set the register to 50.
Type at&w [Return] to save permanently.

Note that this is for a standard Hayes compatible modem. Newer modems
may have extensions to these basic commands so if possible, check the
modem manual first.

Didn't know the Sinclair connection: did it run QL software or was it too
different?

> It looked very interesting but a little difficult to get to grips with
> (this from a man who's worked with IBM mainframes running MVS/XA and
> ICL's running VME :-)

The review I saw of it rather implied it was more trouble than it was
worth!

> My copy is down my shed somewhere along with the STFM (and OS9)

I've come across several references to OS9 in my travels but no real
information on it: was it Atari-only or available on other platforms, and
what was the advantage?

Might as well dredge up all options in case the OS war starts hotting up
again :-)

> K > software can "simulate" the reference lines in the header
> K > ither.
>
> Thank you for the info - I thought that might have something to do
> with it.

A few years ago, my favorite BBS (The BBS) allowed to write in newsgroups. The gateway was done by another BBS and was pretty basic, so it was *mandatory* for us to write by hand the famous "Reference :" line at the very beginning of messages, (only) when they answered to another one, and followed by a *blank line*. The header lines are *case sensitive*.

This header line looks like this:

References : <Message-ID_1> <Message-ID_2> ...

If you answer to the first message in a thread, there is no reference line yet. Create a new one with just the message-ID of the article you are answering to.

If you answer to another message in a thread, copy the existing reference line and append to it the message-ID of the article you are answering to.

More infos in RFC_1036.TXT

Hope this helps.

Bye,
/Pascal/

Yes. If you are getting 'in-flight' compression via the modem the rule of thumb is that the DTE should be 3 or 4 times the DCE so 57k6 is definitely worth going for.

I forget what m/c you have, Mike, but I have heard that the 8MHz models cannot keep up with a DTE greater than 57k6 so this could be your practical limit.

When I send or retrieve mail with Newsie, it takes a long time to make a connection, on the order of 30 seconds. In fact it pauses that long between each letter I upload. I recently was using a friends PC to connect to my ISP and the mail connection was made almost instantaneously.

I think there was some discussion about this a while ago, but I don't remember if there was a solution.

I have also been having a problem with Newsie frequently sending only the mail header and leaving out the body of the letter. It seems a little more reliable at sending mail when I use MIME format. Maybe the "boundary" statement gives it the kick it needs? I'm using QED 4.5 as my editor.

> different?

SMS2 is still alive and under development, but now under the name
SMSQ/E. There are many users out there, and SMSQ/E runs on the Atari
(not the Falcon) and a Milan version is programmed right now. A PC
version (QPC) has become very popular and there are many QL users out
there who have upgraded their QLï¿½s to run SMSQ/E.

Pï¿½l Monstad
formerly a SMSQ/E user
uses a Hades060/MiNT now

Hi! I also use this very app, version 1.2. Think the main advatage to
use this Internet package is that it is very easy to install. If you just
know how a computer should be connected to Internet, then you do not
have to read any manual, to install PPP-Connect and Emailer.

>It let`s me do other things while getting mail and news and it waith for
>me untill I`m ready for the news.

This is a disadvantage with Emailer, you have to download every mail
e.g in comp.sys.atari.st for a presentation of its content. Most newsreaders
downloads headers first and present a list of all mails.

>It`s a little slow when doing a search in a large group file, mine is

Its that time once again! (thunderous drum-roll please-if you don't mind) The Winners at the DarkForce! BBS this month are as follows:

1) Doctor Clu (Greg Goodwin): 1 6 month/3 volume subscription to Atari Computing!

2) Centurion (James Krych): ST-Plus Fanzine!
3) Angle (Shannon Slone): ST-Plus Fanzine!
4) Ttam Troll (Matt Norcross): ST-Plus Fanzine!
5) Starchyld (Chris Hall): ST-Plus Fanzine!

Congratulations to all our lucky winners. Don't forget-you too could be a winner if you call our BBS at least one time each month. All it takes is that one call, and it does not matter how long you stay on. Good luck to all of next months' callers! ;-)

PS You must take a permanent password!

I downloaded PGPSHELL and PGP v2 and managed to create my keys.I was
having difficultly using version 5 but when I changed to version 2 it
worked ok.

My next question......

How do I use PGP with Okami?

I write my message click on the PGP button and PGP does its
stuff.When PGP has finished Okami complains that it could not move
the file.I did check on how much disk space I have left,which is
10MB,so I know that its not lack of disk space.

Any ideas...?

The 040 and 060 boards are the same - the 060 is installed with a small
daughter board, regardless if you buy an upgrade or a new machine with 060.

>Hmmm, I wonder if my Nova scanner driver will work. Do you have full
>control over the CPU's cache settings (both the 68040 and 68060

NovaScan 1.25 works fine - however, 1.26 works better (scans the whole page
in one go without needing to backtrack once).

Ths Milan TOS runs with full 040 caches (both on, copyback mode), but you
can turn them off if you need to.

Hello to all

As I said in a previous message, I've been gone from this newsgroup and the Atari scene for some time. So I have a lot of catching up to do.

I just visited the ST Informer website a few minutes ago to see what is going on there and it appears that the site hasn't been updated in awhile. The latest issue of their online magazine was dated September 1998 (I believe) and there was no mention of whether they will publish future issues.

So, does anyone know the status of ST Informer? Is Rod really gone this time?

Thanks in advance for any help!

Al Horton

> new version ? Are they really more Geneva involved than english one ?????
> That's a true mystery for me ...

It's just a matter of timing, really. At the time when Seidelsoft asked to purchase some copies of Geneva, it turned out to be much easier to give them release 007 than it would have been to go back to 006 and translate it. (I messed up, and didn't have a good backup of the 006 source.)

However, doing a patch program (in English) is VERY time-consuming, and I just haven't had the time to get around to it yet. It's still on my list of things to do, though.

There are no major feature additions in 007; it's almost all bug/compatibility fixes. The most significant one is a fix for the problem with NeoDesk reporting phantom errors when you use the system clipboard in some applications.

As you can't use a bare motherboard without the system software or graphics
card, they come bundled (you would pay much more if you went into a shop and
bought a single VGA card than with the bundle).

>bying the cheepest assembled version and start building up from there. I
>gues the reason why most dealers don't like to sell the kit on its own is

>out of dated material (small IDE harddisk, 2 4MB SIMM's, 16 speed IDE CD
>ROM), they've got hungry kids to feed you know....

At least the SIMMs are no problem - the Milan will only work if you plug at
least 16MB into the first slot. However, you *may* put your old 4MB SIMMs in
the other slots.

Personally, I have an 8-speed CD ROM in my Milan - simply because it works,
it is fast enough, and id is silent and works well with all CDs. I have
faster CD-ROM drives around, but I had no urge to put one in the machine
yet. If you absolutely *need* 40-speed, then go ahead - however, the real
application performance will not go up much, but the noise will.

>According to an advertisement from Milan Computer in the German ST-Computer

>an 68080-UPGRADE wich should be available now (DM999 or ?325). They DO NOT
>mention a MILAN060 so don't get confused.

That seems to be the 060 upgrade, which should be available at the end of
January for that price - must be a typo.

>ASH is a commercial firm, why should they release MAGIC for the Milan, when
>EVERY Milan owner gets NAES for free. I can't imagine they would sell a lot
>of copies. Milan Computer has chosen the NAES-route, if you don't like it
>well one of the options is the HADES060 wich come to think of it, could be
>a better and also cheaper buy in the end.

There *is* work going on for Magic for the Milan (Andreas Kromke has a
machine, and I just phoned him to fix details about it), so please stop
speculating wildly.

>never got the impression that it was the superior machine. When you upgrade
>from a standard ST or Falcon the speed factor will be quit impressive, but

>if you are a Atari user wich has upgraded his gear through th e years to
>something like the configuration mentioned above the Milan might come as a
>disappointment. If anyone is interested in the benchmarks I'll be glad to

I have a TT right beside my Milan, and the TT feels a *low* slower (however, the TT runs in TT-high, and the Milan in 1280*1024*256, so the comparison is even a bit advantageous for the TT).

No. The concept is to have a small board with only the necessary stuff on.
Though many people want SCSI, not all do. SCSI is realized by using an
off-the-shelf Symbios Logic PCI FAST SCSI adapter card - that way, it is
cheaper than when building SCSI onto the main board.

>Does no real harm at all! Any decent newsreader will put your messages
>sorted next to the properly threaded ones anyway. Maybe Peter's reader

Nope. Any *decent* newsreader will show you a threaded display, by using the
References: line. If that is removed by a followup, the whole chain is
broken there, and it won't help me that the following message may be
displayed somewhere near the one where I started - I can't jump in the
thread using the arrow keys, I have to search where to restart reading.

And if the Subject is changed during the discussion (which happens quite
often in some groups), the threading is still correct, but a subject-sorted
display is not, and thus correct References are even more important.

FYI: even the oldest RFCs regarding news *require* that a newsreader handles
References: correct, even if it can't use it. Anything else is broken and
not RFC compliant.

>includes "Re: " when sorting making your posts appear in wrong
>positions? If so a good reason for him to try Okami+Newswatch and maybe
>even try to set up Sting? :-)

As one of the Okami authors, I can tell you definitely that the display in
Okami *will* be broken if References: are omitted.

439. QED Menubar

Newsgroup: comp.sys.atari.st
Date: 1999-01-06 00:00:00 UTC
From: bataille@xs4all.nl
Message-ID: <3693c0241325e70@xs4all.nl>
Source record: 86834

Hello,
when running several programs with Magic and having several windows
open, clicking on a window activates a program. Also the menubar
changes to the active application. This however does not happen with
QED, I always have to switch to that program by ALT-CTRL-TAB to get
it's menubar active. I find this a bit inconvenient; is it a feature
of QED, a bug or a bug in Magic? Can it be changed? Thanks.

If the drive works correct on a PC (ie. jumpered for drive A, twisted
cable), you need to change one setting from DS1 to DS0 to use it in a ST.

On most modern drives, this will be a 0-ohm SMD resistor instead of a
jumper.

Is this program still being produced, and if so what version is it up to?

I've used this and I think it is brilliant, it's outperformed all the viewers I've used on ST/PC with the manipulations it does. I hope it is still being produced, last I saw was v3.8 IIRC

AM.

I think therefore I AM.

Yep, I got the same information from Titan Designs in the UK.

>Suggested retail price DM999 or ?325
Hmmm, if thats the case I don't suppose I could buy the English Milan
from Germany? Just that the UK prices are working out at over 100 UKP
more than this for the motherboard kit.

>Considering the high retail price it seems to me, one is better off bying the
>cheepest assembled version and start building up from there.
Well as mentioned elsewhere I am in the process of building myself a
new PC (sorry guys but that is where I make my money from!) which will
leave me with a AT mini tower case, 64Mb of EDO SIMMs, harddisk and
other related paraphenalia. I was just thinking that instead of
wasting such I would use the opportunity to build a new Atari.

Now although I admit it sounds very sad if I wasn't doing this I would
stick with my TT and Falcon.

I don't really have a need for the Milan other than more possible
horsepower, a more integrated system which takes up less room than the
current setup.

>I gues the reason why most dealers don't like to sell the kit on its own is
>because the Milan is a nice machine to get rid from all their unsold and out
>of dated material (small IDE harddisk, 2 4MB SIMM's, 16 speed IDE CD
>ROM), they've got hungry kids to feed you know....
I can agree with that, however both of the UK dealers have now given
me prices on the motherboard kit, though those prices seem a bit steep
compared to your own quoted price above.

>According to an advertisement from Milan Computer in the German
>ST-Computer magazine, the SCSI-card is now for sale (DM199 or ?70).
>They also mention an 68080-UPGRADE wich should be available now
>(DM999 or ?325). They DO NOT mention a MILAN060 so don't get confused.
Ok, and following Michael Schwingen's post that confirms the existance
of the '060 upgrade (with no mention of a '060 Milan other than the
referral to a Milan prototype which could be taken either way).

This is good news but as I won't be in a position to commit to
anything until sometime in February at the earliest I just hope that
both of these pieces of kit make an appearance with the UK dealers

sometime soon.

>ASH is a commercial firm, why should they release MAGIC for the Milan,

>sell a lot of copies. Milan Computer has chosen the NAES-route, if you don't
>like it well one of the options is the HADES060 wich come to think of it,
>could be a better and also cheaper buy in the end.
Cheaper? It's quite an expensive buy in the UK and I have heard a
couple of horror stories to do with the machines overall reliability.
No if I am going to "upgrade" my Atari setup then the Milan seems to
be the choice for me.

I can suffer ;-) N.AES, from what I've seen of screen shots and
peoples comments it seems quite powerful. I had a desire for Magic
because of my familiarity with it and the lack of configuration needed
when installing but I can (and have done) live with Mint combined with
N.AES.

>If anyone is interested in the benchmarks I'll be glad to post them.
Please do.

I never upgraded the TT because I didn't perceive the performance
upgrade attainable with the CaTTamaran to be worth the potential risks
to the machine. I upgraded the Falcon because I could survive with the
TT if anything went wrong. I just wish for a machine with the power
(or better) of my '040 equiped Falcon but with the graphical ability
and stability of my TT!

>The only thing going for the Milan IMHO is the price, but to turn it into
>a full spec HADES will cost you much more.....and you still will not be
>able to run MagiC.
Well after I had upgraded the Falcon I wished I had just cut my losses
and bought a Hades instead! As it is the Milan with a '060 and SCSI
card will likely cover my Atari needs for the forseeable future (if I
were being totally honest the TT could probably cover them, it doesn't
struggle on the whole but I love new toys ;-)

>I don't know if the Milan is selling well, but I haven't seen any Milan-users
>in the newsgroups or WWW. Perhaps they can't get on the net with the
>supplied Draconis package?
I'm sure we'll find out soon enough in response to your message! ;-)

MB> <> | On | Off
MB> <> -----+-------+------- I don't understand this bit.
MB> <> DTE | 19k2 | 38k4
MB> <> DCE | 19k2 | 28k8

Sorry :-(It doesn't help that the 'On' & 'Off' in the table are
transposed (and I thought I'd checked it before posting)!

IOW, tho', you'd get these conditions:

1) Port upgrade OFF:
a) W0 in INIT string reports 19200 (DTE rate: computer/modem)
b) W2 in INIT string reports 19200 also (_but_ DCE rate:
modem/modem)
2) Port upgrade ON:
a) W0 in INIT string reports 38400 (DTE)
b) W2 in INIT string reports 28800 (DCE)

Of course, W0 in the INIT string is the same as you'd have by
default... (What you started off with.)

I hope that's better :-)

MB> <>Assuming ('cos I can't remember exactly) the port upgrade is for 38k4,
MB> <>and the modem is a 28k8.
MB> Correct.

I thought so (checked Roy Goldings 'List' for the modem) :-)

MB> I tried Misha's suggestion ie. INIT=AT&F2L3W2311=50 and it bombed
MB> out. I then tried Derryk's suggestion to leave the baud rate at
MB> 19200 and still with the above INIT setting..... Bingo
MB> the modem fired off at twice its normal volume and dialled out at
MB> twice the speed. It took me by suprise I hardly noticed the DCE
MB> speed which came and went in a flash, I think it was 26k4.

This sounds good :-) The modem's volume and dial speed are nothing to
do with the port upgrade, but they are nice touches. But no crashes
and getting on-line is the main thing :-)

MB> So my thanks to you guys for all your helpful suggestions, how
MB> anyone can say there's not much for the ST user in this group, I
MB> find hard to understand.

Nice one Derryck for remembering the key point about your type of
upgrade :-)

MB> Re further mods to this upgrade to 57k6 and 115k2 would I
MB> benefit from this with a 28.8 modem? Just a thought.

Yes, but Roger's already answered this :-)

MB> Thanks again
MB> Mike

Enjoy that upgrade!

Cheerio,
Mish

DC> >Oo-err... nothing like the serial port upgrade I have then!
DC>
DC> Which one?

Hi Derryck,

It's The Upgrade Shop's upgrade, which gives 57k6. IIRC I had to
change the setting in STiK for this (using STinG these days, which
doesn't need it setting).

DC> >DC> It should be possible to set the modem to report the serial port speed (DTE)
DC> >DC> rather than the connect speed which should prove the mod.
DC> >
DC> >Now that's the opposite of what I advised :->
DC>

DC> > -----+-------+-------
DC> > DTE | 19k2 | 38k4
DC> > DCE | 19k2 | 28k8
DC>
DC> For I'd expect the DTE figure to be 38400/19200 BUT the DCE to be the same
DC> (the modem should connect at the highest common speed possible?)

Well, I managed to transpose the 'On' and 'Off' headings in that
table...

But, with DCE and port upgrade switched off, I _do_ get 19k2. Honest,
guv! I do!

DC> In the final analysis it would be the number of cps that would matter.

Isn't that always the way, though <smile>?

DC> >IOW, under DCE the modem will only connect at 19k2 IME.
DC>
DC> Not sure what you mean here Misha?

That should have read: 'IOW, under DCE the modem will only connect at
19k2 when the port upgrade is switched off, IME.'

Yikes, I made two critical typoes in one post (even tho' I checked it
over before posting) :-<<

I _think_ that means my eyes need a rest, at the least :-}

> good ftp sites or a local BBS... ;-)

The only problem with ST-TOOLS is it can't do a manual undelete and if the
disc was fragmented it will either not undelete files, or it will mix up
bits of different files.

Another one that's able to do it is Simon Pooles DLII. That will allow
manual undeletes, so you can pick the bits of the file to add. One bad
thing about it is it can't handle hard drive partitions above 16Mb.
Not that this is a problem with floppies...

Then there's KnifeST. It was on a ST Format coverdisc many years ago and,
AFAIK a commercial product that HiSoft sold. Not sure if they still sell
it though. That will let you join clusters to make up the files on another
disc.

I was able to logon to this site with no problems. Make sure your
IRC client version is up to date, as aIRC at one time had the very
problem you are describing. It is possible the servers have added
some new validation sequence. aIRC .97 is the latest.

I am running Cab 2.5d. It plays the background sound of a cow mooing on a demo html document but it won't play the background sound at www.aar.org (loco.wav).

Is there something about this html that is not standard?
It plays ok on my IBM Thinkpad running IE 4.0

K > missing you will often read the "answer" before the
K > "question", that's all.

Huh! I have spent so many years reading in reverse order I don't
think I would know what to do if they were 'logically ordered' :)

I note that microtalk reader doesn't order them at all - just date
order, which means that I have to do a lot more thinking, a painful
process at best.

Nicholas wrote:
>Could you please set your newsreader to limit the line length to 75
>columns. It seems you're using ASH emailer and it's rather annoying >when
>using anything else.

Sorry, I didn't realize that post from ASH Emailer looked different
on other newsreaders. I assumed that all newsreaders wrapped words
automatic.

The problem is: as everyone knows by now, ASH has the habit to do
things different...I have no way of setting the line length, I work
in a resolution of 1024*800 and get a nice big text-editor box wich
is a lot longer then 75 colums.
From now on I'll hit the return key when I reach column 75, so text
should be better readable, if that doesn't work I'll switch to a
text-editor like qed or everest.

Please bare in mind, that I'm new here and I've still got a lot to
learn.(I'm catching it up quit fast though...)

Cheers

Chris asked :
>How easy is it to install in my machine if I leave my TOS in too? Where can
>I buy MagiC on ROM and how much is it (with the SCSI driver, even though
>I don't have a HD now I might get one someday). Maybe I'll install this
>on one of my 1040STs and see if I like it.

Chris, there's a little program called MAGIXROM 1.6 wich transforms Magic
to an IMG-file ready to burn in 2, 4 or 6 EPROMS. Before writing the
IMG-file the program gives you the option to incorporate CBHD -> 4.57,
wich is the SCSI-driver. You will still need a HD-driver program to
format, partition and make it bootable. The driver (SCSI.RAM) will
recognize all connected SCSI-devices and initialize them. So to use a
CD-ROM you'll still need MetaDOS in the auto folder, same goes for
scanner and harddisk drivers. What you don't need anymore is HD.SYS or
something equivalent.

What you need is MagiC, CBHD (wich is PD-soft), a couple of EPROMS and
of course a EPROMBURNER. If you want to keep your old TOS you'll need a
TOS-switcher also.

Keep in mind that MagiC in ROM works a little different then TOS, when
you boot, MagiC will look for a desktop program, so if there's no hard
disk connected you'll have to load it from disk or start a program with
the fileselector. Also to get the max out of MagiC you'll have to Install
the MagiC-folder(START, APP, STOP etc) on a disk.

You can use the ROM's in a 520,1040,MEGA and MEGA STE. Falcon and TT
owners have no luck... it just doesn't work. Until I got my TT I used a
configuration like the one mentioned above, although I had a harddisk
connected wich makes a big difference.
If you're interested I'll email the different needed programs to you.
download CBHD at: http://members.aol/steffene/

Dunno but if it helps I found it ran fine on either an ST or STE under MagiC 2 singletasking. It was actually more reliable!

iirc, I booted in medium rez then launched Civ. I have a vague recollection Populous II worked this way also.

This is not to say Civ doesn't mess with the hardware but as it wasn't graphic intensive might be reasonable to assume it uses the LineA like Maniac Mansion and Zak MacKraken do.

FWIW I've set one of the NVRAM user memories in my modem to report the
actual connect speed so my init string for STinG and most of my other comms
progs is ATZ1 to activate that memory. Semper uses the more usual ATZ tho'
as that already reports the carrier speed.

But Freedom refuse to support TOS calls of the FSEL (such as when saving a CPX's config) and de-installs itself after a while. It really looks nice, but not supporting TOS fileselctor and failing to remain in memory are 2 problems I've never been able to work around... ;/

Pfiew! Finally found a decent replacement for my broken TT RAM, so
the much awaited update to The TT030 Homepage has been uploaded.

Not every section has been HTMLized yet (some people's contributions
were straight text), but there is finally something to get you going.

I hope it was worth the wait! ;-)

Agreed and verified to be true.

Bit of my own story here:

I had to re-install KGMD _3_times_ before it worked on my TT.
_3_times_. Kellis probably remembers me crying that this MiNT
shit was a load of crap over IRC, but I finally got it to work.

Later, when FSCK found a bunch of un-repairable errors at bootup
and yanked me into single-user mode "FSCK failed, booting into
single-user mode. Fix the filesystem and reboot!" I initially
panicked, but eventualy learned how to deal with it. This seldom
happens, but if/when it does I'm ready for it. No sweat. Honest!

Reading MAN pages and actually configuring files by hand in a text
editor (I use Pico or QED) took getting used to, but has become second-
nature; CLI (command line) is also weird at first, but turned out to
be better, for some stuff. For instance, it's _much_ faster to type:

rm *.o

Than to go into Thing, change the mask to *.O, select All, then
drag into the Trashcan.

Learning about file permissions (UMASK, CHMOD, CHGRP -> drwx--x--x)
sounds completely alien at first, but becomes rather usefull when
you start building your homepage. It's really cool to upload files
that already have the proper permissions on them! ;-)

MinixFS (and the whole Inode concept) is also wicked. The hirarchy
of Unix systems completely irrational (at least until you read FHS)
but in the end, it eventually starts to make sense.

Basicaly, give it some time. I've already been using KGMD since
about 1 year and I still learn new stuff every day. ;-)

As long as you managed to connect, boot up Pine or GlueSTiK (if
you prefer GEM stuff), everything is fine.

After that, buy yourself a book on basic Unix stuff (I found mine
at a computer show for 5$) and pour yourself a nice moka coffee.

You've made it that far, so give yourself a pat in the back and
keep it cool. One step at a time, as they say..... ,-)

Well, I have the same annoying problem here >^(. The only serial port
that is working is the com1 port, right. And the problem is, that it
cannot get faster than 19200bps.
I contacted the Milan company about it, and told me that the two fast
serial ports are still not supported. However, they should get some
HSModem drivers out soon, that make use of these ports possible. So
you have to wait until then, I'm afraid.....
BTW I don't know if this problem is only with Sting and not with f.e.
Mintnet.

P > Anyone know if there is a way of viewing *.spd files from
P > K-Spread on my PC?

Which version were they made with? IIRC, KSpread2, which I used quite a bit some time back, didn't load and save Lotus 1-2-3 files. But KSpread4, which I have and am learning, does. It will also convert from KSpread2 to v4. If you can send copies via email, I will give them a try, convert to KSpread4, and then to Lotus wks or wk1 files, and send them back. No guarantees, but it might work.

Hello everyone,

today I received my Adamas update. In the read.me file I saw something
that may be of interest for you.

According to that file the next version of Adamas that is expected to be
released somewhere in februari, should be able to view Java_script.

Besides Java_script the DRACONIS Easy-Internet-Paket PROFESSIONAL 1 will
have a ftp-program and a telnet program.

Also In the maus (some kind of German Usenet) I saw a message about Cab.
Cab v3 is expected every day now. There were however no details what's new.

Sorry guys, don't know what you're all talking about: I have 2.03 running
here, and my system is online 24 hrs/day. Never have a prob with Freedom
not showing up.
As for the CPX-es, I think it shows up when the CPX calls the fsel.
Take "colors-cpx", the one to change or set another palette: I'm damn sure
Freedom then pops in asking me to make a selection.

Perhaps problems with earlier versions? Never used Freedom before 2.01 or
so.

Indeed. The other name of this concept is VFS (Virtual File System).

> allow.
>

Not quite correct. The XFS interface in MiNT (as I understand it, but
the last word always belong to the MiNT maintainer Frank Naumann) has
hardly anything to do with reentrancy. I.e. the current XFS interface
does not imply, that the XFS driver won't be reentrant. In other words:
it is possible to create a reentrant filesystem drivers with no change
to the MiNT XFS interface.

The reentrancy problem applies to the MiNT kernel itself, strictly
speaking to the trap handlers. They're _NOT_ reentrant. Thus, even if
all other parts of MiNT are perfectly reentrant, calling MiNT from MiNT
itself via trap isn't possible at the moment.

That is the reason why a theoretically possible reentrant filesystem
driver wont work in MiNT now. Now it is solved so that the XFS driver
has a direct access to the DOS/BIOS/XBIOS routines in MiNT through a
sort of a jump tables. This doesn't eliminate reentrancy, but also
doesn't allow taskswitching until the actual MiNT call terminates.

In other words: once the MiNT kernel has been called, it can't be called
via trap until the first (say) enter_gemdos() call isn't completed by
the final leave_kernel(). In the scope of enter_gemdos() and
leave_kernel() (they're low level MiNT routines called automatically at
the begin and the end of the trap #1 handler) no MiNT function can be
called via trap.

This is the main concern to solve now (not quite hard really, but must be done and tested carefully).

Anyways, changing this scheme implies that calls to ROM GEMDOS will be no longer possible, thus usage of TOS filesystem will be no longer possible either. We will _have_ to use NEWFAT filesystem, which is lotsa better than TOSFS anyways.

And (I hope) this change may make the MiNT kernel shorter, faster and less kludgy. Actually quite a big part of trap #14 handler code in MiNT is a workaround for a lack of reentrancy.

You can ask why "they" (i.e. Eric R. Smith and other kernel developers in the past) didn't make MiNT reentrant from the beginning. The answer is: because that time MiNT was more a TOS extension than a standalone operating system, and, as an extension, strongly depended on TOS. And that last is not reentrant (at least GEMDOS isn't AFAIK).

Sorry for (maybe) being too technical.

What I MiNT to say (like I said, bad English) is any mail following the first mail sent after NEWSie has been launched will not contain the UUE file. I haven't tried this using b64. I am using MiNT and N.AES. If I send a copy to my self, the UUE part of the file that is suppose to be combined is not present (or contained) after the body of the mail.

>Rgds
>William
>

I've had to do something similar with 5 1/4" disks on my Atari 8-bit
systems from time to time with disks that got things spilled on
them...

Usually I just cut open the black jacket and take the media out, wash
it, and then mount it into the disk drive without the jacket. Since I
usually had the top of the drive unscrewed anyway, it was easy to pop
the top and align the floppy onto the hub before closing the door and
clamping the disk.

Then I'd copy the disk immediately, before anything else happened to
it.

The jackets were usually ruined, as there is a "nappy" fabric liner
inside the jacket whose normal job is to pick up dust from the disk
surface, but which also very readily absorbs juice, coke or iced tea,
making a real mess.

I never had much luck re-inserting the washed disk into the jacket
from another "donor" disk, so copying it was the only real recourse.

(I used to wash the keyboard from my Atari 800 when stuff got spilled
on it. Take it out, hose it off and dry it with a blow dryer. Worked
great! Something you can't do with the new, cheap membrane style
keyboards these days.)

It dates back from the 6800 (later 6809) CPU time. OS-9 was a real
time multitasking opering system with many-users support.
So very good at time-critical control-tasks in factories etc.
It is still around and being very modular is hidden in many embedded
processor systems.
!!! It is much better than Windows CE !!!!!!!!!!
All the Russian rocket stuff had the computers running on derivates
of an illegal OS-9 copy!!!

The latest I hear was a security leak in the handler of the TCP-IP
part for network-connected embedded stuff.

There was a version that ran on the ST.
But as all OS-9 stuff: expensive to buy.
before my Atari time I worked on an C't 68000 VME-bus computer that
was running OS-9 and also PEARL/RTOS.
The one and only teksteditor was priced in those days at $1000.-

Yes, I know....
Sending mail goes well, but starting retrieving takes 40 sec to start.
Most of that time the connection is quiet (no blimping red led's).
At least when I connect with STing (with N.AES)
Do I the same with STIK (single TOS) than it starts without wait.

How come????

>people considering the upgrade to 56K...

I've just upgraded my USR Courier v.everything to v90. V90 is 56k
down/33kup. With STinG set to 57600 I get a 49k3 connection to CiX
internet which averages out to 50k6. CAB using Oliver Booklage's OVL
reports between 5-6k for most files like graphics/zip files. Text gets
ridiculous speeds which are to fast to even notice. I spotted 54k the
other day.

After you've logged off from your ISP type 'ATI6' (that's 'eye' not 'one')
in a comms program like Connect and you'll get a report from your modem
like this:

ati6

USRobotics Courier V.Everything Link Diagnostics...

Chars sent 410218 Chars Received 732759
Chars lost 0
Octets sent 232248 Octets Received 577604
Blocks sent 27000 Blocks Received 20928
Blocks resent 0

Retrains Requested 0 Retrains Granted 0
Line Reversals 0 Blers 102
Link Timeouts 0 Link Naks 0

Data Compression V42BIS 2048/32
Equalisation Long
Fallback Enabled
Protocol LAPM SREJ 128/15
Speed 50666/31200
Last Call 01:55:09

This gives you your connection details to the other modem.

If you put '\V4' in your int string you'll get your connect speed reported
when you logon. This will vary during the length of the call (up or down)
so can't be taken as the actually speed you may be running at.

>Modem negociation on my no-name Rockwell chipset thing takes over 30
>seconds...get used to some funny noises :-))....anyway I don't think you guys
>should upgrade, you'll be using bandwidth I want :-)))...especially if you're on
>Zetnet......

Average connect time 17secs:)

498. Re: Mitsumi Floppy Drive-replacement 1040ST drive

Newsgroup: comp.sys.atari.st
Date: 1999-01-07 00:00:00 UTC
From: Andy Blakely <andy.blakely@pnl.gov>
Message-ID: <369508D0.6CE0DA9A@pnl.gov>
Source record: 86720

I don't know about the Mitsumi drive, but (since I'm in the middle of doing the same thing with a Teac drive) I can tell you that if you only want it to be a 720k drive, you need to (1) switch a jumper from "1" to "0". The default is probably "1", which is for PC's use. The other allows the Atari system to use the drive. My Teac drive's jumpers don't suggest a "1" or "0" anywhere, but just has A thru E with two rows of pins. Maybe yours will make it easier. (2) Turn the ribbon cable upside down and plug it in. You might have to cut the little plastic notch on the cable's connector. Those two steps should do it for you! Now, if you want to make it work with both 720k AND 1.44meg, there are some instructions at the Atari Hardware Hack homepage. You might as well, since it will double your storage capabilities and allows you to use PC formatted disks right out of the package.

By the way, when you test the drive, don't use a valuable disk. It might get ruined.

Hope this helps,
Andy Blakely

I don't use Multistrip on my Hades but I've it installed on my TT030. So
damned slow. I really prefer Taskbar.

That's strange, because I've seen it running fine on a Falcon and my STe
with 020 (in fact it tells me that there's an 020 in it where it says
machine type).

I know it doesn't work well with NVDI because that will screw the colours
up.
Neochrome doesn't work well with NVDI either.

504. Problem with Magic v6

Newsgroup: comp.sys.atari.st
Date: 1999-01-07 00:00:00 UTC
From: leaver@dynamite.com.au
Message-ID: <7738h0del1@bomb.dynamite.com.au>
Source record: 86726

I am attempting to install Magic v6.1 on my TT (with aixiTT ram card and Matrix tc1208 video, Quantum Fireball internal drive and HD Driver v7 on a Syquest cartridge).

Whatever I do, and whether I install it on a plain Syquest cartridge as C drive with only DD driver present, or with NVDI v6, or with NVDI v5 plus the Matrix card software, when I attempt to boot the TT into Magic I get told (in German)

Off-screen driver not found
MCMD will be started
System will be halted

Under the same circumstances, Magic v5 installs and runs on the TT prefectly happily and using the same installation floppy, Magic v6 installs and runs equally well on my MSTe.

Can some kind person give me some clue about how to fix this.

Yes, MultiStrip has very long response-times thanks to it's
custom-made (in windows) popups, but that's not what I mean. The point
is that while earlier versions of MultiStrip was real CPU-hogs (and
the main reason for writing Taskbar in the first place), the latest
version use only twice as much CPU as Taskbar on my Falcon.

What, no drivers for the serial-ports??

> BTW I don't know if this problem is only with Sting and not with f.e.
> Mintnet.

AFAIK the only Milan-specific things in the MiNT-kernel is the new
MFP-adresses, so you can probably not use the new ports in MiNTnet
either :-(

MiNT use RSVF internally (that's why the RSVF-cookie disappears when
running MiNT), so as soon as the HS-Modem drivers are written MiNT
(and MiNTnet) will support the new ports.

I believe that the Universal Item Selector was causing Speed of Light to crash on my TT. It works now that I'm using the Geneva file selector.

BTW, Speed of Light had been working on my Mega Ste along with the Universal Item Selector.

>

1x speed on a CD-ROM is 150Kb/sec. Since the STe bus only runs around 1.5 Mb
(I think I get 1.4 on mine, but I could be wrong) a 16x will only be slightly
faster than an 8x, and any speed higher than 16x will do you no extra good
whatever. I personally use a 4x (600Kb/sec) on my Falcon and a 1x on my STe
-- it actually isn't that slow (a bit faster than floppy). Consequently, I'd
recommend the cheapest thing you can find, which will probably be at least a
4x.

> The other way is Extendos/GOLD or whatever. It's commercial. Think it's
> Anodyne Canada (have I got the name right?) selling it.

Anodyne makes an excellent CD-ROM driver that does not require MiNT. Having
no experience with Spin, I cannot compare them.

> The Atari 8-bit newsgroups have Atari 8-bit information. The C-64 newsgroups have C-64 information. The ST newsgroup has Milan, TT, and Falcon information.
>
Jeff,

The reason this group has a lot of Milan, TT, and Falcon information is because for the most part -- these are just extensions of the same system. If you are looking for things for a 1040STf with no hard drive, great. 85% of the software I have will run on them just fine.

I still use my 4 Mb STe pretty much every week as a child's computer, a game computer, and an extra word processing station when my wife also wants to type. Until early 1997, the STe was my ONLY computer, so I'm quite well versed in it and will be happy to help upon request.

Some unsolicited advice:

-- you will be rather limited graphically by the lack of a hard drive and high color mode. The years I had only my STe, I stuck to text: text internet, text word processing, etc.. Line art, of course, is fine.

-- games are quite nice on an ST. In particular, get the basics -- chess, backgammon, solitare. They are better on computer than real life (my mother uses her computer almost exclusively to play bridge and mahjohngg.)

-- basic word processing, spreadsheets, databases, etc. will run fine and are mostly freely available.

-- you may not think you need a hard drive. You don't, but they are VERY nice.

-- once you have a hard drive, you may not think you need a replacement desktop. You don't, but they are VERY nice. I like NeoDesk, personally.

-- once you have a hard drive and replacement desktop, you may not think you need a replacement OS. With a 2 Mb computer, I'd agree. If you ever upgrade to 4 Mb, it is also real nice.

You see, we were once as you are now. I started in 1990 with a 1/2 Mb STFM, color monitor, and 1200 baud modem and used my Atari solely for word

processing and email (text, of course). As the years went by we kept adding stuff (the hard drive and NeoDesk were the big improvements, followed by the Falcon). If you stick around with this hobby you too will slowly accumulate things and then questions like "Does SCANX run on the Milan" or "Does NDVI 5 have a HP 692 driver" will indeed be interesting.

Until then:

1) Ask questions about anything you wish.
2) Note the websites mentioned in this newsgroup -- visit them
3) Play around with software

Hello! Do I understand this to mean that you are printing with NDVI 4 (5?)
using a HP694C? I've been looking for this info!

NEWSie is unfortunely not the cleanest piece of software around, and
AFAIK John Rojewski develops it under MagiC so it's no wonder it works
best there. I believe most of the problems has been with disk I/O,
what kind of partition do you run it on?

GlueSTiK isn't entirely STiNG-compatible either, but most apps seems
to work fine with it. I remember having problems with an early version
of TelSTAR, and the CAB.OVL's for STiK has never been that good
either. But otherwise it's OK, aFTP, Antmail and the various
irc-clients work fine here.

> I've fetched Taskbar, it sure looks nice, but I think Multistrip (now on
> v. 1.4 here) offers some features I prefer: setting up the strip
> vertically (so I can accomodate more apps without the need to scroll),

You don't have to scroll at all with Taskbar, it behaves like the
Windows taskbar and shortens application-names so all buttons fits on
the screen at once.

> access to all CPX'es, Thing groups etc with folding menu's etc). Not that
^^^^^^^^^^^^^^
What exactly do you mean with "folding menus"? Taskbar also use Thing
groups to build the application-menu in case you haven't noticed.
MultiStrip can also be configured to display any group-file in a
popup-menu at the mouse-cursor when you select one on the desktop,
Taskbar can't do this (yet) if that's what you're referring to.

> The thing I'm slightly worried about is the fact that here Mint/N.AES
> frequently freezes/locks up completely on operations in the taskmanager.

Taskmanager? Which one? N.AES doesn't have one, is it the
process-manager in MultiStrip you're talking about?

I sell my Falcon 030, 4MB memory, with colour Atari PTC1426 Monitor, with
SCSI II 1.1 GB harddisk , with SPDIF in/out up to 24 bits on input only.
Cubase audio for falcon with dongle key latest 3..06 version with original
manuals on original box.
Great condition.
This is the machine that rules for dance music.
Best offer will take.
Happy New Year.
Dimitrios

Hi everyone !

This is my first posting ever but i was hoping for some help. I've just bought a
Milan and i was wondering if someone could help me get Sting above 19200bps.
I don't know if it's the Milan's new ports or if it's something with Naes.
Also how do i get Nvdi to work under Naes? Any help or comments appreciated.

This is news to me. The mail processing puts the text and attachment
into a single file. There is not an easy way to explain how just part
of a file you get sent. None of my beta testers have experienced this
problem.

What do you mean by 'concurrent emails'. Concurrent means 'at the
same time', and NEWSie has only a single socket to the mail server,
which means that mail is sent (and receive) one at a time, one
following the next.

I will test this myself.
John

>I can't believe that worked. The disk door is still a little sticky
>(not as bad as the saved game disks are though) but the game itself works.

Over here in Singapore, the weather is great for fungus growth - humid & warm.
So my diskette will "die" after months (read years) of non-usage. The
solution to retrieve data from them is to wash the media. Open the "back" of
the diskette, ie the opposite end of the sliding door and tip out the magnetic
media. Wash with water (yes, sometimes under a tap !), dry it with tissue (
should be non-lint paper but ....) and tip it back into the plastic casing.
Use sticky tape to fasten the back of the diskette. Now the floppy is
readable. Succes rate is over 90%, one must be careful not to bent the media
while tipping it in & out. And this way, the sliding door is still in perfect
working condition.

Source record: 86772

Hello!
Well many of you may have noticed that my MagiC page has not been updated in quite awhile. Well, that is due to the fact that I do not have any web space available anymore. The page currently at http://bengy.atari.org will stay there, but I have no way of updating it (my account has been canceled). I canceled my account for several reasons, one of which is soon cable internet will be here (have to find a way to hook it up to the Falcon030, I know it's possible).
Anyway, I have thought about using GeoCities, Angelfire etc., but I myself personally hate those places with a passion.
So please spread the word to anyone who's interested. The MagiC page is not dead, it just cant be updated ATM, until I find a new home.
Thank you for your patience,
Bengy

>
>Any ideas...?

Possibly, although it could be well off the mark. Is there an error
returned by PGP after it's signed and/or encrypted the message? If
so, what is it? If not, have you set the path for the TMP variable
inside "O.INF" to a partition different to the one Okami is running
from? It could be that Okami is trying to rename a file, which works
the same as a move only on the same partition, and is producing the
error because it's unable do so.

Apart from these guesses, I can't help you, since I don't use Okamis
PGP function.

That's what I noticed when I made the 57k6 mod. The drop was quite marked
as well, going from ~3000cps down to ~2500cps :(With a null modem, or
BBS call, I can run quite happily at 57k6 and have no problems. All I want
to do now is get my hands on one of the Veloce+ upgrades and see what a
difference that makes.

>>>It should be possible to set the modem to report the serial port speed (DTE)

Ah, but once the upgrades working perfectly the DCE speed is much more
interesting to know. When I do use BBSs, and I could do with a list of
UK based Atari supporting BBSs to add to the couple of Acorn supporting
BBSs I use, if there is such a list available, I have the init string
set to report both DTE and DCE speeds (use "W1" for those interested).

>Is this possible???
>
>Thanks
>
>
Steve:

YES..it is possable. First transfer the Sysex files from your PC to a disc..the TT should be able to read PC formatted discs. Then use a program such as Ben Halls MIDI DUMPER or the excellent program MIDIAN (available on the Unich FTP site) and load the sysex file to the program, set your synth to the correct midi channels and whatever procedure it uses to accept a bulk dump, and WALAH..the sounds are in the ZI. From there you can load XOR and dump the sounds into a library for easier access.

Hope this helps!

how about the tried and true MISSILE COMMAND!!! I still Love that
game!

I also like the seirra games like Camolot, Space Quest and Kings Quest
..hard to figure out though.

Rampage IS also Fun..just kill everything!

For my TT though I like SPACE BALLS...the pinball game. Works well in
TT med..i don't have to go to st low.
Also the PD version of MA-Jong..... Q: any other ma-jong games for
ST/TT?

Thats it for now!

I use my TT for mostly Music and art /internet stuff...but my Mega STe
is a super Game Machine!

I don't own a Milan myself, but as I understand it one of the serial ports
(as with the Hades) is limited to a maximumm speed of 19,200. Perhaps you
could try using the other serial port.

Regards,

Ben Hills.

> I don't know if it's the Milan's new ports or if it's something with Naes.

It's definitely not N.AES's fault, and since I believe that STiNG does
not use any direct hardware-calls it should be enough to use the fast
serial-port, not the old MFP-port. I don't have a Milan so I don't
know which port is the "real" serial-port.

> Also how do i get Nvdi to work under Naes? Any help or comments appreciated.

Put it in the autofolder, preferably after the graphics-cards VDI and
before MiNT.prg. It might conflict with the Milan-VDI (whatever it's
called) if you have a old NVDI-version.

Hi Roger,
I'm using an STFM on the internet. I do have a Mega STE
but can't use that for internet use, it corrupts any compressed files
I download. I gather it needs a replacement GAL chip. Whenever I've
tried to source a replacement I've never got anywhere, there seems an
air of mystery about it. I did speak to Dave Escott of TUS at the
Stafford show and he suggested I should connect the Mega STE up
sometime and let him send me a compressed file. I am then to return it
to him for examination and hopefully some answers. However leading up
to Xmas and to present I've just not found the time. I must make a
special effort.

On a brighter note the port upgrade on the STFM is working, and
following your comments, I'll be making that trip to Maplins ASAP to
upgrade it even faster.

Thanks for your help.

Hi J-E,

I know about Newsie :-) been working with it since 0.80. You mite remember the probs I had at first. Actually, I started using it on my C:\, but set it up again on my I:\ drive a while ago.
>
>GlueSTiK isn't entirely STiNG-compatible either, but most apps seems

>irc-clients work fine here.

It's Newsie only, giving me slight probs on Gluestik (tks Kath for explaining). If I skip the decoding and fetch next articles, it's just fine. Don't use IRC clients, I've been running two just to check them out a while ago, but the regular ones I use are News/popwatch, aFTP, CAB. These are all fine, where the aFTP/Mintnet version is a bit faster.

>
>Taskmanager? Which one? N.AES doesn't have one, is it the
>process-manager in MultiStrip you're talking about?
>
I've definitely got to do some more sorting-out with Taskbar, it was the very first impression. "Looks" is OK with me, about same features as MStrip (well, you can set shades and all that too in Taskbar). The process manager of MStrip appears to be more sluggish running under Mint than running under MagiC. But indeed, I very much like MagiC's taskmanager.

I've been trying running Sting again on Mint, but it appears to be hanging several times straight after logging in. Next the batch login is supposed to be running, and it just won't start. Tried it 10 times with my ISP last nite and it wouldn't go (except for the first time). Finally switched to MagiC and it ran 3 times after another... Using pppd/gluestik works far better.

I'm a bit short on time available the next few weeks (too bad X-mas holidays are over) but will keep you posted.

I still use the ST quite a bit for games, and I'm well aware of the impending scarcity of DD floppies (and the impending death of all my existing ones...OK it'll be a few years, but floppies do eventually go bad, and some of my older ones are getting a bit unreliable already). Other than using an emulator, is there a way of putting games on a HD, and running them from there? I'm specifically referring to previously commercially available games* I have, that fail to run if GEM is loaded...making them quite difficult to run from the HD! It's probably a tall order, but I do still want to play these ST games in the future, and the prospect of running them on a PC (which either shrinks the ST screen down to a little box, or does it full screen and shows up 320x200 to be a bit poo really) doesn't fill me with joy exactly.

Upgrading the floppy drive to a HD one would stall for time, I suppose, but I'm not entirely certain that HD drives can read some of the weird formats that the ST can produce. My PC's drive definitely can't.

Can anybody help?...or alternatively tell me that I'm requesting the impossible.

Thanks,

Trystan

* It would have to be the hacked versions though (Pompey P. etc.), due to the copy protection (or lack of).

Thanks. I've switched to the Green ROMP (0845 212 0666) and am getting
42/44K reported. CAB downloads from Demon web sites report
7-9Kbytes/sec.- a distinct improvement.

Incidentally, the Demon local access numbers, and K56/x2/V90, web sites
have a last update date of August 1998. Not surprisingly, V90 is
regarded as a furure possibility.

Generally speaking - no :-(Games, demos and compilations are very often
hardcoded to use A:\, many of them will also access the hardware directly.

> Can anybody help?...or alternatively tell me that I'm requesting the
> impossible.

Your best bet would be to use MSA or a similar tool to store images of your
games on the harddisk or a CD, and write them back to healthy floppies when
you want to play them.

It should also be possible to design a "faked" floppydrive with 1Mb RAM and a
parallell-port. Disk-images could then be uploaded to this from your ST or
PC, and the ST would never know the difference. Anyone with a
GAL/PAL-programmer and some skills (i.e. somebody else than me...) could
easily make such a device.

>Okay gang, your turn. What ST games really turned your crank.

Hello

So many games to choose from that listing just ten favorites would be almost imposible. So I'll just name off some that I have played over and over (in no particular order):

1) Railroad Tycoon - love this game where I try to run my own business (Hmm.... sounds similar to what I did in real life...grin). So many things to do and control.

2) Sim City - again, creating-building-running-controling your own empire. And no two games are ever the same.

3) Dungeon Master and Chaos Strikes Back - 'nuff said.

4) Alternate Reality - loved both chapters on the 8bit and was very disappointed that only "The City" made it to the ST. The ST version gave you a little more as you could take employment to raise cash for needed items.

5) Deuterous - GREAT, GREAT, GREAT game where you had to control planets, fight wars, and discover the "secret".

6) Supremacy - another strategy game where you had to fight off invaders planet by planet while constantly making decisions on where to allocate your limited resources.

7) Rampart - Tetris with a big twist. Loved the easy concept of the game that allowed you to jump right in and enjoy it.

8) Curse of the Azure Bonds - one of the few Advanced Dungeons & Dragons games from SSI that made it onto the ST. GREAT roleplaying with strategic combat. I wish more of the "Gold Box" games had made it onto the ST.

9) Tetris - tried and true. Great escape game that is so simple but oh so addictive.

10) Bubble Bobble - GREAT, GREAT two player game. Didn't care for solo mode but could spend hours competing against another person.

Those were commercial games and I have also many, many favorite PD/Shareware games: Pacman on E's, Starball, Realms of Reality (VERY close to Dungeon Master), Towers, Hero, Orbit (still the best Breakout/Arkanoid clone around, IMHO)and ANYTHING by Dave Munsie, especially Berzerk.

Good topic and look forward to reading other's lists.

Al Horton

Most of protected games will run only from floppy. In that case may help some program, which makes file images of floppyes, like MSA and similar. You may store then safely those images on hard disk, or even put it to CD. When you wants play game, put it back to floppy(es), and go...
There are some programs for PC like Makedisk and similar, mostly used with Pacifist. They do job (making floppy image) in most cases, but very slowly.

HD (high density) floppy attached to ST can read everything, what DD drive. Reason why PC can't read all weird Atari formats is in different floppy controller.

MiNT is still kicking and alive.

MultiTOS is surely a reality. Nowadays it's called N.AES and is IMHO the
best multitasking system around for the moment. It runs on every machine
which can't be said of some other multitasking systems.

DC>
DC> I can't think of any reason why it shouldn't help and the extra memory
DC> wouldn't come amiss. Adding MagiC would help too. Hopefully someone will be
DC> along with some practical experiences tho'.

Hi Derryck, David,

Here's my practical experience...

This STe has the TUS port upgrade; a fixed speedup of 57k6. Now,
pre-Veloce+ IIRC it used to average about what David says, ~2500cps.
(I use Peter R's SERIAL.CPX, and had that set for 57k6.)

This of course, was better performance than without the upgrade, and
being a newbie I wasn't to know any better ;-) (Also, I'm only
talking about 'net connections (STiK/STinG) not BBS's or anything.)

So, along came the Veloce+, and after a while I had a thought - 'Why
not try setting 115k2 in the .CPX, and see what gives?' - and that
made an improvement... sustained throughput went up to ~3200cps. This
with MagiC 4 at the time.

I just decided that the upgrade had to be giving 115k2 as its fixed
speedup, and that my partner (who ordered the upgrade) hadn't asked
anyone at TUS the right question...

Anyway, since upgrading to MagiC 6, I've been experiencing some
problems with 'net speed, which seem to be related to extended header
flags (TT-RAM & TTalloc), CBHD & WBDAEMON. Right now, I'm not sure
exactly what the situation is (I've been taking in tech info from
Robert Goldsmith on the zetnet-atarians mail list), and am going to
try and pin it down this weekend <G>.

But, in checking things out I went back to DTE rate reporting at connect time, and guess what? The port upgrade _is_ just 57k6, whether or not the .CPX is set for 115k2 :-}

So I suppose this leaves me slightly muddled (I hope you're not feeling the same <G>), and this weekend's troubleshooting is going to have to count as going back to school ;-)

One thing to check while I do is what difference in performance I _do_ get, rather than what I _think_ I get. I'll be sure to be thorough...

Other than that, the Veloce+ has been generally very good, with few compatibility problems (tho' I don't run much in the way of really old software). The extra memory is a great boon too :-)

554. help with FaST board for Mega ST

Newsgroup: comp.sys.atari.st
Date: 1999-01-08 00:00:00 UTC
From: Ken Macdonald <macdonald@cfc.dnd.ca>
Message-ID: <369674E4.AF7F6A4A@cfc.dnd.ca>
Source record: 86599

Hi!
TAF has a Mega4 with a FaST accelerator board attached to it that
is/was used to produce our clubs newsletter "Phoenix" on.
The FaST board is no longer working, and it might be impossible
to repair. One fellow who looked at it says it is a multilayer board.
Do anyone know anything about these FaST accelerator boards?
Can they be repaired? Are they still being made? Can they be purchased?
Having the extra memory and 68030 CPU made newsletter work much
faSTer! :-)
ken

Well the SIMMs I currently have in the PC are 32Mb each so I assume
they will work as primary and secondary.

>Personally, I have an 8-speed CD ROM in my Milan - simply because it works,
>it is fast enough, and id is silent and works well with all CDs. I have
Agreed, I have survived with 2x CDROM's on all but the desktop PC and
that only got upgraded to a 12x because some game wouldn't play
without a faster one (don't play games on the Atari, the PC's for
that! ;-)

>That seems to be the 060 upgrade, which should be available at the end of
>January for that price - must be a typo.
I just hope to see these items make an appearance over here.

>I have a TT right beside my Milan, and the TT feels a *low* slower (however,
>the TT runs in TT-high, and the Milan in 1280*1024*256, so the comparison is
>even a bit advantageous for the TT).
Well my TT runs in 1280x1024x256 so it would be a fair comparison. And
on this point can the supplied S3 Virge graphics card have its RAM
upgraded and if so does that mean the Milan could do the likes of
1280x1024x65536 or better?

I think I've got 1.25, maybe its time to go back to Nima.

>Ths Milan TOS runs with full 040 caches (both on, copyback mode), but you

I was just asking as I know I have to disable the instruction cache on
my Falcon when using the scanner otherwise the software reports
something about an invalid command.

Well I never tried it myself but I do recall reading that QL text mode
applications ran successfully under SMS2.

>The review I saw of it rather implied it was more trouble than it was
>worth!
Hmmm, a bit. Its expense didn't help either. I really bought it to
have a play around with, never really used it for anything, just went
back to my OS9 and Magic.

>I've come across several references to OS9 in my travels but no real
>information on it: was it Atari-only or available on other platforms, and
>what was the advantage?
It was originally developed for the Motorola 68xx processor line and
was subsequently available on a wide range of machines (I have v1.0 on
a Dragon 64 down the shed with 2 disk drives). It was later developed
for the 68xxx line (though the Atari port was done by Cumana).

The advantage was it was multitasking, resource efficient (the Dragon
64 was a 1Mhz 6809 CPU with 64K of RAM and when the OS was loaded you
had somewhere in the region of 48-50K free) and realtime (though I've
never used this part of it). Also it was used in a number of
commercial arenas which meant in theory you had access o software
otherwise unavailable.

OS9 still lives on in a number of guises OS9000 (I think) for the PC
as well as embedded versions, etc. There are even set top boxes which
use it. It is similar in some ways to Linux (and porting programs
between the two isn't meant to be that tricky).

>Might as well dredge up all options in case the OS war starts hotting up
>again :-)
For a friendly OS I would stick with something like Magic.

>
> So, does anyone know the status of ST Informer? Is Rod really gone this time?

Guess I need to set the record straigh on ST Informer since I was the person
who published six issues on the web. I enjoyed doing the site but I really
didn't get any feeback from Rod. So it began to seem like I was on my own.
Nothing against Rod personally, mind you. So, I figured that if I'm on my
own, I might as well do my own thing and make the site free like I wanted
and have no potential for LOOMING deadlines which sometimes made the ffort
less fun. This way I'll also have more time to work on the design of the
site. My new site is at:

http://fujinews.atari.org.

I plan to make this site a daily news page for Atari products and include
special articles submitted from people (there's an article about Duece '98
there now). Good idea? Bad idea? Oh, and it hasn't been updated in a bit
because I'm in the process of moving currently.

Thanks for asking about ST Informer and I hope you'll consider viewing the
new site and sending suggestions.

It ran every QL application, both text based and those running under the
Pointer Environment. SMSQ/E has higher resolution than the original QL
and the old programs which was written for mode 8 dindï¿½t work.

The maximum you can achieve with a standard S3-card is 1024x768x65536.
Anything above can't use more than 256 colors (even with a 4 MB card),
as the RAM on the card is too slow to handle useful refresh rates with
Hi- or TrueColor in higher resolutions.

Ciao

Nope... although it is still available and registrations are being
accepted. I am in touch with the author and recently sent him a
Christmas bonus (a cheque in loads of USD for loads of registrations
received over the past year via CyberSTrider)

>I've used this and I think it is brilliant, it's outperformed all the
>viewers I've used on ST/PC with the manipulations it does. I hope it is
>still being produced, last I saw was v3.8 IIRC

Yep, it has stayed at v3.8 - but hey, why look for an update in a
program when it is already doing everything you want it to and
perfectly? :)

BTW, registrations are via CyberSTrider, and the price has just come
down from 20 UKP to 16 UKP. Email me if you want an order form.

This posting indeed looks like you've taken me the wrong way. Maybe you should
note that I'm just a hobby programmer too, so I'm not "blaming" others.

> In my opinion, anyone who takes the time to write an Atari program and then
> freely shares that program with other Atari users should be commended.

So ? I haven't written that I want them discouraged. Praising a programmer
(or others, doesn't just apply to programmers) to much makes him sit on his
butt and not doing anything good anymore. So take my comment as "constructive
criticism", as encouragement to do better (care more for compatibility).

> I, for one, would not call a programmer lazy just because his effort only runs

STinG reports what the modem tells it. See the FAQ in STING.HYP
The speed reported by NEWSie appears far to optimistic, distrust it !
That fast can only ever be text files where the modem data compression
is effective. With binaries (archives), even ISDN only does about
7 KB/s.

What about me ? ;-)
I get this delay both for sending and retrieving mails.

> It is not the problem of SMTP server, because if I send e-mail with a PC,
> there is no delay.

Yes, it is (server dependent), but only occures with STinG. I've no
problems with at least two other ISP I tested, still with STinG.

I believe Peter is aware of this.

If You already have the Dr T version (which I beleive is the ONLY
version of XOR) All you have to do is go to the MOTU site , go to the
Unisyn downloads area, pick PC , and dowmload the profiles for your
respective synths. Then after unzipping them, change the extentions to
where XOR will reconize them (.xor for the profile .hlp for the
help file) THATS IT!! Enjoy!

Something like this exists for the 8-bit Atari: just a cable running from the Atari's I/O port to the PC's serial port, with appropriate software running on the PC. The disk images are stored on the PC, which "loads" them into its virtual disk drive. All the Atari sees is a normal disk (albeit a fast one). It works really well, and I haven't touched a real disk for ages!

Would this be a difficult thing to implement with the ST?

Strange! It is contrary to my observations!
When sending mail with STiNG I *always* have 30 sec delay, no matter I am using NEWSIE or POPwatch. Retrieving mail starts immediately.
It is not the problem of SMTP server, because if I send e-mail with a PC, there is no delay.

>Most of that time the connection is quiet (no blimping red led's).

The same at me. With one exception: I have green led's ;)
Maybe it depends on OS? My is TOS 2.06 on MEGA STE 4 MB.

Peter! Solve this problem, please! It is really annoing!

thats not working.I did read the log and that tells me that it the
file is not found.Part of my log file is below.

08 Jan 99 09:31:48 ***Error moving g:\tmp\00000001.tmp -> g:\tmp\00000000.tmp (File not
found)
08 Jan 99 09:31:58 Terminated.

08 Jan 99 09:40:46 ***Error moving g:\tmp\00000002.tmp -> g:\tmp\00000001.tmp (File not
found)

I have tried creating dummy 00000000.tmp and 000000001.tmp files to
see if Okami will find the files but the same thing happens.

>Apart from these guesses, I can't help you, since I don't use Okamis
>PGP function.

How do you attach your signature to your messages?

Do you add it after or before you export the messages?

Do you use pgpshell or pgp.ttp directly?

Gordy.

Christian Felsch has just released Ghostscript V1.2 with the announcement
that this is to be the last version programmed by him.

The source code is now included, so if anyone wants to take up the baton
then they will be most welcome.

Christian's home page is http://www.tu-harburg.de/~smcf1605

English text and RSC files will follow as soon as I'm able to get them
organised, however it's anticipated that anyone familiar with the last
release won't have any problems getting it up and running!

Watch out for an announcement in comp.sys.atari.st

Nope, you'll need an accelerator and probably MagiC to squeeze much more
than 38400, since the processor is otherwise not fast enough to empty the
serial port buffer in time.

You'll have to run Okami, NEWSie or one of the other newsreaders mentioned in this group alongside STinG, STiK (or IConnect if you go for ASH's reader).

Mountain Reader is only a QWK packet reader for BBSs IIRC and therefore won't be compatible.

I don't know the specs for your printer but I made an HP660 driver for NVDI 4 which gave 300*300 dpi in colour and 300 and 600*600 dpi in B&W using the HP550 driver as a basis, and adding codes for the higher B&W res's using codes from one of the Laserjet drivers (and the makeprn utility). It wasn't too hard, however with a later release of NVDI a "proper" driver was issued which added 600dpi greyscale printing.

HTH.

Source record: 86666

Mega 4 with TOS 1.04, Fast Tech T-25 (25mhz) card and 19" Moniterm monitor and driver card. This computer is fast and reliable and served me well for years. I would like to get $300 for it with the Moniterm, but will consider all offers.

Might consider partial trades of hardware or software.

For instance; I could use a 28.8 or faster modem, memory chips or boards for a TT, an Atari Portfolio or something similar, a Jaguar, or whatever else you want to offer. Software I could use; Calamus, Magic, Kobold, CAB.

On Thu, 07 Jan 1999 wrote:

> soon cable internet will be here (have to find a way to hook it up to the
> Falcon030, I know it's possible).

In the town where I live cable-internet is already a fact of live, sadly not
for me though.... You see, I'm using the wrong computer... I should get a
Mac or Windows-box so I can connect the Ethernet signal to the computer....

Serious now: I don't know on what system cable-internet is based in England, but I think it
will be the same thing, Motorala is the only big
supplier of Cable Modems, so nearly all cablefirms use their system. There's
nothing wrong with the system but the sad fact is that there is no way to
connect a Ethernet signal to a Atari (all models). The only option is to use
a Milan Or Hades with networkcard.

There have been a couple of Ethernet VME-interfaces available in Germany, but they are hard
to find, and the software needs a big overhaul.....

The only possible solution I know of is to buy the VEROX convertor, this
pricey little box converts a ethernet signal into a LANport signal.
Biggest disadvantage : maximum speed 230000 baud, witch is a lot faster then
what we've got right now, but it's not a real solution. Besides the VEROX
asking price is somewhere in the region of ï¿½800....

Does anyone knows something I don't ? Is anyone working on a project ? Is
anyone with a HADES or MILAN connected to cable internet ?? Is anyone reading
this ?

Cheers from Belgium

608. Timesharing in MiNT

Newsgroup: comp.sys.atari.st
Date: 1999-01-08 00:00:00 UTC
From: Brent Thirsk <thirsk@telusplanet.net>
Message-ID: <369614FF.6E0D@telusplanet.net>
Source record: 86671

I have a question on timeshareing with Mint 1.4.7.
I have one application I wrote that will open a linked list database
file, read each record, up date one variable in the record, and go
on to the next record. the file remains open until the last record is
updated, and then closed. Normally my applications will open a file,
read a record, update it, and close file for each record read.
With this program that leaves the file open, I find time sharing seems
to have stopped. All other terminals become frozen until this
application has finished updating the file it has opened.

When a file is opened, is time share stopped until file is closed.
I had always assumed it was, as you may try to open the same file handle
with another application if the kernal allowed a file to remain open
when another process is allowed to run.

Any ideas on this.

Hi Louis! Can't help with the MIME encoded files, because I have the
same problem. However, I simply disabled the UUD.TTP program by renaming
it to UUD.TTX, and let Newsie handle UUencoded files itself-internally.
This works fine. Hope this helps! ;-)

Hey Ron!

Argh!! In posting my list of 10 games I had completely forgotten about these two and I know that there are MANY more.

Ishar is GREAT; and.... (hanging head) I never completed Bards Tale. Guess I'll have to go back and give it another try.

You also spoke of Space Quest and its humor. Another Shareware game that I think is as good as any commerical release is Grandad 1 & 2. GREAT humor and graphics! And "Amberstar" was very good also, though short.

Been some time since I've talked to you, Ron. Hope everything is well and that your Atari's are purring along.

Al Horton

That's cos the local access numbers all plug into the Energis ROMP, IIRC,
so you get to the same equipment as if you'd dialled the 0845 number for
Energis.

Oops, sorry, that should be the Red ROMP, now shouldn't it? :-)

<snipped the lot>

Well, I gotta add some of my favs in :)

Captive - This was an excellent game, I just had so much fun with them droids :)

Knightmare - This was the version by Mindscape, and was pretty much the same as Captive as far as the game engine goes, but it had spells and all sorts of cool stuff in it, and it took me bloody ages to complete it :)

Elite 2 - What can I say, this is a great trading game, the battles can be dodgy on an ST with it being so slow, but I survive :)

Turrican 1&2 - These were brilliant, probably the best platformers I've ever played :)

Pacman - I love pacman and all it's spin off games, there's just something addictive about controlling a sphere that seems to eat forever without actually getting fat :P

There are many many more, but these are ones that have stood out and I've played for weeks & weeks. Even now I can just boot em and carry on playing, they are great :)

AM.

I think therefore I AM.

Does anyone know wether this monitor has a switchable power supply?
Can it work both on American 117v and European 230v or only either?

Thanks.

> a Milan Or Hades with networkcard.

There is one way, and that is to build a simple parallelport-adapter
for the ROMport and use a D-Link DE600 pocket ethernet-adapter. There
are drivers for MiNTnet and TUW/TCP, but unfortunely the DE600 is very
hard to find :-(IIRC two french guys worked on drivers for more
modern (and available!) adapters, but I haven't heard anything from
them since last summer.

> There have been a couple of Ethernet VME-interfaces available in
> Germany, but they are hard to find, and the software needs a big
> overhaul.....

Michael Schwingen has designed a VME<->ISA adapter that's so compact
you can fit the adapter and a NE2000-compatible ethernet-card inside
the VME-slot in standard TTs and Mega STEs. The hardware is
practically finished, but so far there's only drivers for TUW/TCP.

There's also Titan's Eclipse, which (theoretically) will allow you to
connect a PCI-card to a Falcon and use the PCI-drivers for Hades and
Milan.

And I know that there exists NE2000-drivers (IIRC for STiNG) that
works with the Panther ISA-interface for ST, so there are more
solutions than you'd think :-)

1. Super Sprint. I used to play this with two cousins, usually I won
but when I didn't I totally lost it and beat the crap out of my (then)
smaller cousins. I also smashed several joysticks.

2. North & South. Now *that's* a funny and addictive game!

3. Midi-Maze. Do I need to comment this?

I don't think I really played any other games on my ST...

<>
<>Rgds, Derryck

Aah - and I was halfway to Preston to fetch the parts to further
upgrade to 57k6! I do have Magic 6 & NVDI 5 but no other accelerator.
Actually there doesn't seem a noticable increase in Newsie mail/news.
With CAB it starts off at roughly double the previous speed, but
quickly drops to anything between 200 and 1600. Makes you wonder if
it was worth upgrading to 38k4, as these were the sort of speeds I
was previously getting.
Cheers
Mike

Well, I've talked to people that has 115k2 mods in their STEs, and
they claim that 57k6 works fine under MagiC. Not under TOS or MiNT
though.

630. Soldering-floppy drive modification

Newsgroup: comp.sys.atari.st
Date: 1999-01-08 00:00:00 UTC
From: Alyre Chiasson <chiassa@umoncton.ca>
Message-ID: <36966B84.B128B3C1@umoncton.ca>
Source record: 86693

I need to short both the disk detect and the HD detect switches (I have a 1040ST). My Mitsumi floppy drive has two black plastic pieces over each of the holes if a disk was inserted. I was expecting to find two leads after reading the modifications that one would have to make to a sony floppy drive but find three leads in my case. Do I short them all, or just a pair, if so which ones?

The resistor that I need to desolder in the back is extremely small, perhaps 2 mm. What is the best way to remove it to the DSO pad without messing everthing up?

Thanks

Alyre Chiasson

Adamas uses his own TCP/IP stack which is IMHO a real pity. However the
setup is much easier then Sting.

Way back I've seen some postings in the Maus about the support of STing and
MiNTnet. It's believed that one is working on it but so far it can't be
used with Sting or MiNTnet.

As somebody already pointed out, there are docs, both in English and German. XHDI is an interface for handling hard disks and such devices at very low level. Not really useful for anyone but system programmers.

> MiNT - multitasking Kernal. Does this need N.AES as it needs > MiNT?

N.AES needs MiNT (N.AES is MiNT's GUI), but MiNT doesn't need N.AES to run.

> FreeMint - The latest new generation of MiNT.

The name "MiNT" is restricted to the original kernel copyrighted by Eric R. Smith and Atari Corp. Formally FreeMiNT is a freeware derivative of MiNT. Really original MiNT development continues under the name of FreeMiNT due to some legal reasons etc.

> Minix - another OS.
>
> MinixFS - The Minix File System, MiNT needed (I'm not sure why).

Because MiNT uses Minix filesystem V2 as an Unix FS.

> PPPkit - Everything you need to get on the internet. Still a bit
> confused about what it can and can't do.

Somebody called it "a toy version of MiNT Net". A preconfigured setup allowing you to get into Internet using MiNT Net, but not learning anything. Deadly needs a modernization.

> N.AES - a new AES replacement. Not free? MiNT needs this and
> this needs MiNT?

Commercial GUI for MiNT.

> Vfat - changes the type of FAT table on the hard drive. What does
> this run under? Obviously a other-than-tos partitioin > would
> be needed, right? Would that be Minixfs?

No. VFAT is an extension for FAT filesystem. Basically, it just allows to use long filenames on FAT FS. This is completely different from Minix FS.

Under VFAT FAT tables arent changed, just new entry types are used
those can be misunderstood by tools written for pure FAT FS.

> XaAES - another AES. Free? Only runs/needed under Mint?

Free GUI for MiNT. Currently under development for quite a long
while.

> Reentrant - some kind of operating system feature?

If a routine can be aborted at any time, then restarted from the
beginning without bad effects and data loss, it is reentrant.

> CDRomXFS - another File system?

Yes.

> Draconis -

Internet pack.

Like yourself I appreciate that. What I fail to understand is how come
a translation hasn't come about slowly. If someone were to host the
docs on their website with one link per function/topic then folks who
visited might think "hmm, I've some time, I'll translate a couple and
email them back." These could be uploaded next to the german docs.

My experience is that I can retrieve mail instantaneously. Sending mail takes at least 30 seconds to connect. Sending News is fast. Receiving News is fast.

If you start the Sting Tools, you will see that during the 30 second wait, there are dropped packets (either TCP or UDP I think). I never had this problem with STIK. But, when I used Stik, I used SLIP instead of PPP.

Haha, nice try. I see we meet again:-)

N.AES doesn't run on Mac's and pc's, we both know that.
My understanding is that the original poster was asking if MiNT was still
alive. I give him a proper answer.
He wasn't talking about Atari-emulators but about *real Atari machines.*
Now, we both know that with these machines N.AES runs very nice which -and
you know that also- can't be said of some other multitasking systems.

>
>right from the scratch without problems? Which ST emulation do I have to

In the case of real Atari machines N.AES can be run right from the box.
Mind you I'm talking about the basic configuration which is for the most
users enough.

>URL for downloading a (demo-)version?

AFAIK there isn't one.

OK I'll bite (*possibly*... :-))

I've just picked up the archive (for MagiC5) from funet and it unpacks to
nearly a meg, though there are some sample programs in there which wouldn't
need translating (?).

I'm assuming that this wouldn't be high traffic, so I could put them up on
my site. However it would take a bit of work to get into shape
(semi-automated conversion to HTML and creation of index pages). One link
per topic would increase the workload dramatically, but the archive is
split up into several docs anyway with only a few large ones: I would
envisage keeping the files and directory structure as they are at least
initially.

Another thought: I don't currently own Gemtrade, but if I were to buy a
copy would it be worth running the docs through it as a starting point or
is the output likely to be too garbled to be worth the time and expense?

I have two major handicaps in this case: I don't know any German worth a
damn and I'm not a programmer! So, before I dive in, are there any
potential takers for this kind of thing or would I be wasting my time?

Show of virtual hands, please!

647. Re: Serial Port Upgrade

Newsgroup: comp.sys.atari.st
Date: 1999-01-09 00:00:00 UTC
From: rcain@zetnet.co.uk
Message-ID: <777neu$5ds$3@roch.zetnet.co.uk>
Source record: 86452

On 8 Jan 1999 20:57:28 G, Misha O'Neill wrote:

>But, in checking things out I went back to DTE rate reporting at
>connect time, and guess what? The port upgrade _is_ just 57k6, whether
>or not the .CPX is set for 115k2 :-}

Yes. This upgrade (and the DIY 4040 chip upgrade) completely ignore
any software clock settings and just do their own thing which is why I
built a revert-to-normal switch into my old 4040 mod. so that I could
handle applications (e.g. fax) which would not tolerate the fixed,
high DTE.

>One thing to check while I do is what difference in performance I _do_
>get, rather than what I _think_ I get. I'll be sure to be thorough...

This is desperately difficult what with packet-switching in the
network and in-flight compression. e.g if you receive a straight text
file with loads of modem-compression potential your client will report
staggering bps throughput. If you receive a file which has been
compressed by software (ZIP/LZH) the compression potential is low and
your client will report a more normal throughput. ALSO ... you cannot
rely on the clients measurement of throughput as there are all sorts
of approximate algorithms which can be used to generate a 'rate'
(depends a lot on the width of the timeslot over which you measure the
bps).

I wonder whether the best performance measurement might be to time a
fixed number of 'Pings' to your ISP using the STiNG dialer tools?

You MUST use an interface card. ATM Link 2 is the one being sold new.

If you keep watching in this area you may find people offering second
hand SCSI shoe-boxes as they are unlikely to need these when they
upgrade to TT or Falcon (these models have built-in SCSI ports).

Andrew,

Subject: WTB: Atari SM124 Mono Monitor

>Mine just died... anyone have a good condition SM124 to sell?

I have a spare SM147 available. Its Atari's 14" monochrome monitor (as opposed to the 12" SM124). The picture display is considerably larger, but the SM147 does not have a built-in speaker. If interested, you an have it for $35 plus shipping cost (allow $12 for shipping).

You have a real attitude problem Tony :(

> This "we know best" attitude from AC really stinks...My point was that

This and my previous message has nothing whatsoever to do with AC. To keep you happy I've temporarily joined CSAS with my personal account so that you can't moan that I'm posting on behalf of AC. I'm not! It is my personal viewpoint based on my experience. Having to reply to "non-productive" and argumentative posts like this is a waste of my time in writing and everybody else in downloading and reading.

I don't "know best" but I'm personally fed up with the bickering that's going on. All it does is put people off, and chase them away. I enjoy being part of the Atari "community" it sounds as if you don't :((

> AC are not the only ones giving there time for free.. the difference
> is that the rest dont keep shouting it from the rooftops :(

Give it a rest Tony. Nobody is shouting anything. You seem to be "deliberately" misunderstanding what people are saying. If you are doing this to create "debate" there are better ways. All you've done is put me (and I suspect many others) off participating in this. I wonder how many people have resigned CSAS because of this nonsense :((

> And anyway.. AC have since posted that they are profit making..

Sigh!

Tony, you don't obviously read AC because ALL our readers were informed in the editorial column in #8 that AC was now published by Renegade Publishing Ltd, a company formed after the ACG (the previous publishers) were advised to do so to remain within the law. There's no secret about AC being a commercial company, which is entitled to make a profit.

The only alternative to not forming a commercial company was to cease publishing.

Most clubs/enthusiast-type groups of any sort that have some form of public and financial involvement MUST meet UK Inland Revenue regulations in order to keep on the right side of the law.

As a commercial company we have to pay bills and tax, so we must make some money to survive. The difference is that we don't make enough to pay wages. Nobody receives a wage from Atari Computing!

If any of us involved with AC were doing it for money it simply wouldn't be around.

We do it for fun and our readers. You're obviously not one, if you were, you would have known the current AC status for the last 12 months!

> so get off your high horse for a bit eh?

I apologise, I humble myself at the feet of the great Tony [s]. Where exactly do you think you get off telling me or anyone else what to do, say or think?

I will no longer be responding to posts that are blatantly provocative for the sake of

>Now, we both know that with these machines N.AES runs very nice which -and
>you know that also- can't be said of some other multitasking systems.

Yup, it's me again :-)

Rite... there must be something behind those statements...

For the time being - and you know I'm clumsy - I've still got a different
one:
Mint/N.AES NOT being as stable on my set (repeat that: MY SET) as MagiC
ever has been.
Still some probs with some apps when using something else than a 10x16
font in the AES (and yes, the same apps do NOT have problems with those
fonts running from MagiC, or even worse: old TOS+GDOS+VDIfont.prg...)

I'm not a Mint/whatever hater, but since MagiC has been running perfectly
on my real Atari machine for about 2 years, I'd like to see things
corrected.

Now, all these apps running quite happy on my set, certainly haven't been
written for MagiC especially... That's Write, Gemview, Graftool,
Superbase, to name but a few. Some existed before MagiC did.

Now I know there's apps getting severe conflicts with MagiC, so I tried
some of them from Mint/N.AES: Skyplot started loading and that was it.
When I did an "aufraumen", the app had not loaded at all. And I did the
"aufraumen" because the starting screen was sitting there after 15 mins,
so I decided to take a look what had happened: just nothing, it started
loading and then quit.

Don't wanna start another discussion on the pro's and con's of whatever
vs. whatever, but this is the situation here. Could improve of course, I'm
only working since a week with it... :-)

659. ASH's Fiffi FTP client

Newsgroup: comp.sys.atari.st
Date: 1999-01-09 00:00:00 UTC
From: derryck@TAKE.THIS.OUTcix.co.uk
Message-ID: <7780h5$9f0$2@news6.svr.pol.co.uk>
Source record: 86464

Hi All,

I've been playing with Fiffi (ooh err missus) recently - it's a neat FTP client (multiple parallel online ftp sessions), but I can't see the purpose of the "Protokoll" config (and the directory that I'm invited to set when clicking on it), nor the purpose of the setting "FTP-Sitzungen protokollieren", both in the "General" settings dialog.

A general outline of the settings in the "Internet" dialog would also be appreciated, especially the last two settings!

Any ideas anyone please? - there are no docs with this utility.

660. NEWSwatch 2.50 released

Newsgroup: comp.sys.atari.st
Date: 1999-01-09 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <3697783eadefc1@the-gap.demon.co.uk>
Source record: 86465
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

NEWSwatch 2.50 is now available from my web site. It's been a long time in the making, but is now finally released!

The *biggest* change since 2.11 is the addition of a very flexible KILL processing facility. There are many other changes too, so please give it a try!

For those who don't know what NEWSwatch is:

It works with STinG and STiK, and allows sending/receiving of usenet articles. It should be used in conjunction with Okami 1.34, Oasis1.35, or Oasis2, which provide the offline reading/editing facilities.

The 25 UKP is for the 15/16 bit upgrade module for the card - not the card itself.

Yes. I've investigated this. It is not the graphics board itself which
they are selling at this price, just some sort of extension.

I don't know the application, Derryck, but these will be used to
provide logs (Protokollen) for your FTP sessions.

>ever has been.

He, I don't have it about stability but about the fact that N.AES runs on
EVERY machine, be it a humble Mega 4 or the latest Milan. That's what for
the moment can't be said about MaciC. It won't run on the Milan. It
won't run on the Hades except if you buy a special version which maybe
can't be used then on for instance a TT030.
I know every OS has his faults. N.AES is surely not bug free but it does
his job very well on *every* true Atari. Do you get the picture now.

>Still some probs with some apps when using something else than a 10x16
>font in the AES (and yes, the same apps do NOT have problems with those
>fonts running from MagiC, or even worse: old TOS+GDOS+VDIfont.prg...)

I don't know where you're talking about. Can you give me an example of a
font which give you probs? I always use Monaco monospace.
I've tried it a few times with a proportional font but this wasn't good at
all, but he my brother has the same problem on his Mac G3 using MagicMac
v6.
Today I tried it with Rufus T-mail ANSI. No prob whatsoever, only I don't
like it.
>
>I'm not a Mint/whatever hater, but since MagiC has been running perfectly
>on my real Atari machine for about 2 years, I'd like to see things

Ofcourse but this can I say about N.AES. I use N.AES since late 1996.
Solid like a rock. All the prog I've with the exception of ConVector works
very fine. Even my very first prog I bought back in 1988, Superbase Pro
still runs with N.AES.
>
>Now, all these apps running quite happy on my set, certainly haven't been
>written for MagiC especially... That's Write, Gemview, Graftool,
>Superbase, to name but a few. Some existed before MagiC did.

Yep, and they all runs very nice on my Hades 060 with N.AES.
>
>Now I know there's apps getting severe conflicts with MagiC, so I tried

>some of them from Mint/N.AES: Skyplot started loading and that was it.
>When I did an "aufraumen", the app had not loaded at all.

Any idea where I can find this? This must be a very badly written prog

Hello all Atarians out there.

I have a problem installing HDdriver on my Falcon with external SCSI Quantum Prodrive 425F.I have partitions CDE on it,but HDdriver recognises them as DEF.When i install the driver,the Falcon will not boot up,probably because Atari only will boot up from partition C.My Atari hddriver works fine.
I tried to install HDDriver on one(...)of my MegaSTes and it worked fine.SUGGESTIONS ANYONE?

P.S. The next time a PC user nags you,ask him where his 1990 AT is now...

682. Mint Timesharing question

Newsgroup: comp.sys.atari.st
Date: 1999-01-09 00:00:00 UTC
From: Brent Thirsk <thirsk@telusplanet.net>
Message-ID: <3697CE7F.7AA4@telusplanet.net>
Source record: 86487

I am using MiNT 1.4.7
My question is how timeshare is implemented during file access.

I have one application that opens a linked list file, update one
variable in each record, and closes the file upon completion.
Timeshare appears to have stopped during this process, as all terminals
are frozen until this application has completed it's task.

All of my other applictions open a file, read a record, possibly update
it, and close the file for each record read. Time share is normal here.

Is timesharing stopped while a process still has a file open.

Fiffi saves a log file with commands that the app and the server communicate
with, such as error messages, login, the welcome message, etc
for each ftp-server you visit. Fiffi creates these files by itself.

>A general outline of the settings in the "Internet" dialog would also be
>appreciated, especially the last two settings!

Passive mode forces data connections to be established by the client,
rather than the server. Generally, this mode may be required for users
who are behind a router-based firewall.

Hi!

A new local ISP here in Gothenburg that provides a free Internet
connection uses the CHAP (Challenge Handshake Authentication
Protocol) to verify a safe connection, rather then the PAP (Password
Authentication Protocol).

Both PPP-Connect and STinG supports PAP. Was the CHAP
protocol ever discussed for those apps?

Yes, for the CD32, but I have read some on the net and in one part of
that game, the droids is sitting in a cab, talking with the driver :(?
Seems odd to be a follow-up to Captive.

I am moving slowly through Captive now to document all the clipboards.
A really enjoyable game, indeed.

I never played it, I saw a screenshot of it and that was about it. It looked like a sort of intro thing. If it's not in the true Captive style though, it doesn't seem worth playing

> I am moving slowly through Captive now to document all the clipboards.
> A really enjoyable game, indeed.

Did you know that dropping a flambos gas canister into fire and picking it up again increases the amount of ammo in it from 20 to 60 :)

AM.

I think therefore I AM.

>Please send me info via e-mail to the address below.
>
>Your help is appreciated.

I've wrote a program just for this problem.

It goes into your Auto folder and on bootup it asks you the time, date, and the day. The day bit isn't really important, it's just extra "code" for other programs I write. It'll look for that file, to work out the day,

You'll need a hard-drive though, since it saves/reads to/from c:\Auto

Email for it

691. KiSS Doll Viewers/Creators For The ST?

Newsgroup: comp.sys.atari.st
Date: 1999-01-09 00:00:00 UTC
From: ad329@james.hwcn.org
Message-ID: <778kaq$60e@james.hwcn.org>
Source record: 86546

Still waiting for an answer on my previously posted question about
KiSS Doll Viewers/Creators for the Atari ST. There are ones for the PC,
Mac, and the Amiga (I think there's another platform too) but I have not seen
any yet for the Atari ST. Granted the ST would have some difficulty doing
the 256 colour KiSS Dolls but it should be able to handle the 16 colour ones
just fine (and maybe it could use some sort of coversion routine to make
the 256 colour ones into 16 colour ones).

Anyways if there are any KiSS Doll fans out there who know of Viewers/Creators
for the ST please let me know as well as the URL where I can find one.
If there are any Atari ST Programmers out there looking for a project
to take on, maybe you might want to think about making a KiSS Doll
Viewer/Creator for the Atari ST.

It always gets under my skin when the Amiga gets invited to the party and
the Atari ST is left out in the cold. We can do these sort of things just
as good as the PC, Mac, and Amiga (although we'll have to fudge the 256
coloured ones a bit). Sure the resolutions are higher than the ST usually
shows, but we could always include a feature to convert it to 320x200 or
to give us a scrolling display.

693. Anime Games For The ST?

Newsgroup: comp.sys.atari.st
Date: 1999-01-09 00:00:00 UTC
From: ad329@james.hwcn.org
Message-ID: <778kar$60g@james.hwcn.org>
Source record: 86548

Are there any games for the Atari ST that are based on Anime series.
The only one I know of that comes close is Battletech but it's not Anime
series. Well, maybe you could count Bubble Bobble but it's kind of
backwards since the game inspired an Anime series.

Hello Louis...

listen to that one, it's been few weeks I try to beat my own record
(stupid one I know), the maximum running application at the same time
without crashing, or freezing, or getting too slow.

Well, so far 74. (I even made a ps > ps.txt
In those 74 applications, well, basically everything I have on my
harddrive was up and running.
CAB, irc, telnet, papyrus (with 1 big document with pictures), atari
works, Smurf demo, games, etc etc, well, and the worst is that it was in
TC mode on my falcon! (baaad machine I heard)
Finnaly, I ran imagecopy and that was it, no crash though, just couldn't
rn anymore programs, double clicked, nothing happened. Then I quit image
copy, no other program would run. Everything was still running fine, just
NO possibility to start new applications, (well so long for imagecopy, I
don't know what it did, but it did it ;)
Anyway, in those extreme case of use, i have proven to myself that I could
have confidence in this naes/mint OS. I don't have no fear to have like 10
applications running, and yet, working on some important data.
Thing that was IMPOSSIBLE when I used magic, always worried if it would
crash before I would save my document or not, so I was saving every 2 min,
just in case, when it crash, I had a pretty fresh backup.
With naes, I don't have this fear anymore. That's the whole charm about
MiNT/Naes, now if all you can say is that the font (that you want to use)
doesn't look right, oh well, then please by all means :) magic will
display the font correctly.. use magic :)
I use some weird fonts that I made/edited, I just know that they shouldn't
be proportional, do you understand what proportional means for a font?
Couldn't find an equivalent of your favorite font in monospaced?

Tell me which program behaves badly under naes but works perfectly under
magic, I want to try that. really curious..
geez, I even run doom (ID src compiled with gcc/mintlibs) from mint, works
perfect, comes back fine and all. Same for almost all the games and demo.
Last time I was doing some ftp, and got from the web Bunion from reservoir
gods, (great falcon game btw), I just have confidence in this setup,

I just unpacked it, and ran it, didn't care about the running application,
coz I know it won't be a prob to run a game over it.
I played it, and came back all good. It might work under magic as well,
but i don't have such a confidence. (after I kissed the FAT of my C drive
2 times, no thanks.., not anymore, no more of magic.)

> so I decided to take a look what had happened: just nothing, it started
> loading and then quit.

could i try this program? and see if it crashes here also on my naes
setup.
Just curious.

> it? What is the gameplay like? What is the plot (if any)?

If you'd checked the url, you would have seen a bit of the plot to it, and
some description.

Imagine dungeon master, but you control droids who can fight with both
hands. It's the same sort of layout, the droids can be upgraded piece by
piece, and you have to find your master who is controlling you through his
laptop in his prison cell.

You have to collect the cash along the way if you want any chance of
surviving, because you need it to buy equip and pay for repairs or new
parts.

You also need power, which can be gained from sockets or a recharger (needs
small amount of power to power it)

AM.

I think therefore I AM.

You're almost certainly right. What I was thinking about when I wrote that was, when I had a Primenet shell account, I almost tried to do a qwk transfer and read the mail offline. Didn't ever actually try it, since it didn't cost anything to read messages online in pine, but it sure looked like it would work. At least there were options to create a qwk packet, which then showed up in the files area (I got that far), which is all it should take.

Well I have a 16MHZ 4MEG STe with no fancy operating systems
as such and use extendos pro with a scsi link cable and can
report good speed from my Pioneer 32x speed CDROM. Not quite
as fast as when linked to a PC but over a meg a second
possibly 1.5MEG a second.

I've just compiled my first Atari CD on the PC (much of my
Atari collection was getting a bit manky as it dates back
almost ten years so I decided to backup as much as I could
and release a few spare floppys). 600MEG of software with
only one disc box representing non-backupable software. I
now have 5 empty disc boxes too.

The term 'concurrent' in this case is probably meant to mean one after
another.

I wrote 5 mails the other day each with a different attachment and
queued them as usual. When sending only the first arrived with its
attachment, the others minus theirs. The only way I could find to get
around the problem was to [quit] Newsie after each mail and start again.

The person who was expecting the mail/attachments told me that 4 hadn't
arrived and explained his way of dealing with it, i.e. as above and he
uses a Standard STe with MagiC and NVDI.

>installs and runs equally well on my MSTe.

Further to my previous post (in which I think I have discovered what
is going on, but I don't understand why it's happening.

I am using HD Driver v 7.00 and Magic v 6.01. After Magic has
started, even if I exit to TOS by holding down both shift keys, it
appears that the drive Magic is booting from no longer exists in the
system, so it is no wonder that Magic can't find its files.

Do I need a update of HD Driver?

Why is this a problem on the TT but not on the MSTe? Bus arbitration
perhaps? Why a problem with Magic 6 but not Magic 5?

Hi AM! Yep, I thoroughly enjoyed this game as well. Nice too that it can be found to run on the Falcon, ST or 8-Bit line! ;-)

HH will also let you "swear" at it. For example:

Use some really harsh language and it will respond with:

"Such language in a high class establishment like this"

Eat me gives you:

"Auto-cannibalism is NOT the answer"

Rape the dog (don't ask-long story-but I was really ticked off at the dog that follows you on the path after leaving the bar. I gave it beer, peanuts, the sandwich, the finger, nothing would stop it from barking and running around my feet!) The game responds with:

"I suggest you take a cold shower" (I just about busted a gut!) ;-)))

Later...

Sure! I remember the reviews, on Grandad 1/2. Got very good ones. Ah, I
think AmberStar is an awesome RPG, especially for what performance it
manages to squeeze out of a stock ST. I do have a problem with it though.
The authors specifically state that it is unfriendly to ANY Atari that
has had the nerve to be upgraded. This kind of attitude really ticks me
off. ;(

Would have loved to have got it working on my Falcon... ;-)

Yep, all my Atari's are still in there swingin'! ;-))))

Talk at ya later! ;-)

Hey Dennis!

As I remember, caged artist was before and probalbly part of the concept of XOR, which then was taken over by MOTU with Unisyn.(I could be wrong). Looking at the old ads in STart magazine, it looked like Caged Artist Products were ONE synth specific products (such as an FBo1 Editor.) They could be tied into Dr T's KCS sequencer program under the MPE envirment. You can do the same with XOR.

That's my comment!

I don't use Cubase Audio, but running Cubase Score the MROS file has to be in a folder named MROS and this folder is in the same folder as CUBSCORE.PRG.

My MROS does not have a file extension. (You can use a file extension to disable an unwanted version of MROS.)

Cheers

Paul

>in the "General" settings dialog.

Hi Derryck

In General Settings the 3 directoryes is for: Recive, Send and the LOG file.
After that you select how big a Data-block you want to use while sending
or reciving files.

Then is the option to sort the directory on the FTP-server by names.
Next is a option to show dirs before files.
The 3th option is for FIFI to turn all uploading files into lowercase.
Then comes the LOG file option, activate it.

The Protokoll is a LOG file, you select the dir. you want that LOG file to
go to.

If you don`t want to use the MagiC fileselector, and last if you want FIFI
to save your settings when quitting.

>
>A general outline of the settings in the "Internet" dialog would also be
>appreciated, especially the last two settings!
>
>Any ideas anyone please? - there are no docs with this utility.
>
>Rgds, Derryck
>

On the Internet Optionen, the first 3 in Allgemein (Global)
1st. activated, and FIFI will start IConnect if needed. When you choose
a ftp server from the hotlist.
2de. make the connection to the server
3th. disconnect when quitting FIFI.

Then comes all the ports for commands, don`t know, but I`ll leave them
all as standard.
The transferetype is set to auto. and for the unbekannten Dataiendung, set it
to Binar. The unbekannten dataiendung is = Unknown data-extension, I think.

I`m not to sure about the last two. I did try to set the FTP-Server in passiven zustand, but was not abel to get anything back from the server, no dir or anything. Actually it didn`t respond to anything.

The last is, I think, a option to send a signal to the server every x-minute. I have that one activated.

BTW. In the Hotlist, you don`t have to use the name and password option. Well, I never do. Just leave it open, FIFI get this information from IConnect. Only use the FTP adress and any dir. you want to go to.

cheers

On the E-bay web auction site, they often have people selling them off
now since Mac & PC users keep needing larger drives. Note, Syquest
has gone into bankruptcy protection currently, the 135 hasn't been
made for about 2 years I'd guess, but are in the used market.
I got 2 of them myself along with 2 230 megs (note, the 230 meg SCSI
ez-flyers have 25 pin connections which are hard to cable a ICD Link
or Link 96/97 to.

But, saw some currently at about $50 for the drive and 10 cartridges
or other items like that. Go to http://www.ebay.com and
when the main page comes up, click on search and search for
Syquest which gets usually about 25-100 hits for various Syquest
drives. If your not needing large sizes, you can pick up a 44 meg or
88 meg drive really cheap.. I got 3 44 meg drives for less than $20
on one bid. Cart's sometimes come with or seperate..

As always, Buyers beware, but I'd purchased about 50 items
from E-bay auction site and only been ripped off three times,
2 on the same game for a PC (Duke Nukem) and once on some
Used SCSI drive mech's that never arrived.

Latter Mike

Source record: 86505

yes there is a falcon doom engine that uses .wad files from pc. it all features the original has i believe BUT is awfully slow. you would need at least real 32MHz cpu and preferably 25MHz bus clock. i don't remember where i found it but here is the readme file of it. try a search engine.

Henry

Martin Wilson wrote:

> Fully playable?

```
/-----------------------------------------------------------------\
| |
| DOOM (the real) v0.01 Freeware |
| |
| March, 11th 1998 for Falcon 030ï¿½ |
| |
| by Patrice MANDIN |
| |
\-----------------------------------------------------------------/
```

Here is the original DOOM engine for Atari Falcon 030.
It was compiled with GCC, under Mint. It runs in 16 bits TrueColor mode.
It uses FastRam if you have some. It should work on all Falcons (Centurbo, Afterburner, etc...). It needs a lot (really lot!) memory. Boot with CONTROL key pressed on a 4Megs Falcon: with 4Megs, the "zone" gets only 2,3Megs (it is displayed when starting).

- Controls:

Mouse : yes left button: forward
right button: fire

Joystick: yes

Joypad: no

Keyboard: F11 -> '(' on numeric pad
F12 -> ')' on numeric pad
Pause -> Help
-,+ -> '-','+' on numeric pad

- Miscellaneous:

Neither sound, nor music for the moment
No network mode for the moment
Code is 100% 68030 (it does not use DSP at all)
Palette is bad in invulnerable mode (Palette -> TC problem)

Joypad will be ok a next time
The "doomrc" contains the preferences, use this one for start.
the "in.tg1" contains the font for the speed display (in top right).

- WAD you can use:

DOOM.WAD : DOOM registered
DOOM1.WAD : DOOM shareware
DOOM2.WAD : DOOM 2
DOOMU.WAD : Ultimate DOOM

- Author of this port:

Patrice MANDIN (DATA from TRIO)
19 Rue des Astiers
85280 LA FERRIERE
FRANCE

- Have fun !

PS:
I already done a DOOM engine. As original sources are available,
I don't have to continue this previous engine. But the work done could help
me do a DSP version (I hope).

The company that recently purchased ataricentral.com and atari.net from Toad computers is Multimedia 1.0, a retail gaming store located in NYC. (http://www.multimedia1.com) Since I am the webmaster for Multimedia 1.0, and will be the webmaster for ataricentral.com and atari.net, I can give you a pretty good idea at this stage about what we plan to do with them.

For one, both the Atari ST and Jaguar message boards will continue to be hosted with only minor changes. We will, for instance, begin pruning posts older than 1 year. If there is a demand for access to these older posts, we will definitely consider adding an archive of some sort. Unfortunately, making this transition will require some work... so there will most likely be a short period of downtime for the boards while we prepare them for the new host. Since some of you are continuing to post while we work with a copy of the message board files, many of the more recent posts may not be immediately available when the boards come back online. If they become available to us, we plan to merge these posts with the posts we currently have to work with.

Ataricentral.com will most likely be seperated from atari.net. The message boards as well as other free Atari-related services will probably be located at atari.net, while we plan to develop ataricentral.com as a more commercial site featuring a full range of Atari products.

If you were/are a regular visitor to ataricentral.com, I'd certainly appreciate hearing from you regarding your wishes for the reopening of these sites. Any suggestions you have will be seriously considered, and could easily shape the content of these domains before and after they come back online. Please send your specific questions and suggestions to:

mailto:webmaster@multimedia1.com

I am aware there are a great number of regular visitors to the boards who may wish to provide input, so my only request is that you keep your messages to this address as concise and relevant as possible. Please save general comments for the boards once they return. :)

Hope this clears up most of the concerns out there.

> Base 64? I have to find the file and drag and drop it to munpack.ttp

Mike, here's an extract from Newsie.Txt

:Support Program(s)
: With NEWSie 0.54, the UUD.TTP program is provided. It should be placed
: in the directory configured as the Work Path. This program provides
: the service of decoding any UUEncoded data in retrieved messages. This
: encoded data is most generally a binary file (picture or program). The
: 'Extract Binaries' menu item in the Special Menu uses this program.
: With NEWSie 0.90 the UUDecode function can be performed internally, so
: UUD.TTP is no longer required.
< Note that last sentence; you and I are using 0.92. >

: With version 0.74, the MUNPACK.TTP program is provided. It should also
: be placed in the Work Path directory. This program provides the service
: of decoding MIME uncoded data (base64, etc.). The 'Extract Binaries'
: menu will examine the current file and select this module if the article
: or messages contains MIME control statements. Many thanks to programmer
: Jos den Bekker for writing this fine program.

That's why I have only Munpack.ttp in the Work directory. UUD files
are decoded by Newsie itself.

In Preferences/General Options, I left blank the appropriate boxes
about decoding attachments, so when I read (offline) a message that
has a MIME attachment, I just click Extract on the tool bar: Newsie
directs Munpack to do it and save it in the Work path, with the
filename shown at the MIME header message. There is no need to search
for the file, if you are already reading the `carrier-message'.

It amuses me that some ignorant sites send an Error Message to the
effect that "Your reader does not understand MIME, so you cannot read
this" -- followed by the complete message in clear :) :)

Hope this and other's suggestions are helpful.
Cheers, Charles.

I have had Proscore (demo) for some time, but have not had the
opportunity to get down to it. From the example provided with it
I'd say it's a cracker, but a few problems crop up for me on
my TT with MagiC, NVDI etc etc. [BTW, "it's a cracker" is high
praise, not criticism.] I need time to sort things out and then
I will register, for sure.

Cheers, Charles.

The Deka from Wizztronics will work with any ST/e/MegaST/e/TT/Falcon and comes with adapters to connect to the motherboard. I think the one that Alex sold was a case to remount the Atari keyboard and an extension cable (Free Keys?). ChroMagic also sold one for recasing inside a tower. The Deka works great, but I had compatibility problems with Video Master ST/Falcon hardware when connected.

(Shameless plug here) I have a Deka that I would let go for 1/2 a motorcycle payment.

rcain@zetnet.co.uk (Roger Cain) writes:

> I wonder whether the best performance measurement might be to time a
> fixed number of 'Pings' to your ISP using the STiNG dialer tools?

No it's not. Ping gives you a figure of latency along the line, which is
a quantity vastly different from bandwidth, which is what you're talking
about here. For measuring that, transfer a big file, either by ftp or http,
and divide the size by the transmission time. The client can give you a
figure too, but in many clients calculation of that figure is not very well
done, so distrust it (as you mentioned too in your posting).

Note TCP/IP has some overhead so the figure you gain will be to conservative
by a few percent.

Cheers Peter

Why should Geneva care about long filenames? If you can get it to work
stable under MiNT it will happily work with any filesystem.

Since MiNT doesn't (yet) have background FS-access all other IO will
be blocked or very slow if a process does some very intencive IO. So
if you update every record in a 20Mb file this will appear to block
all other IO.

> All of my other applictions open a file, read a record, possibly update
> it, and close the file for each record read. Time share is normal here.

You probably just don't notice it because you read/write very small
chunks.

>like it.

Martin, the probs are with some apps, not all.

Newswatch displays expected nr of articles, received bytes, transferrate
etc. All the last chars are not displayed. Like 14763 bytes displays as
1476. Same with Mintsetter; it has some fields where you can edit things:
all last chars not shown. Setting up Toswin2, you can define the amount of
lines buffered or something: I set it to 99, because only 2 possible
positions were shown. I'm not so sure whether it will take 999, but it
could be...?
Funny thing is that other apps show the stuff OK.
And that's with Rufus T-mail, a monospaced font, 9x14. Same with 7x12 AES
type font I have here, also monospaced. I'll have to check with 10x16
types again, not sure whether or not the prob exists with such types.

>>
>>Now I know there's apps getting severe conflicts with MagiC, so I tried

>>When I did an "aufraumen", the app had not loaded at all.
>
>Any idea where I can find this? This must be a very badly written prog
>
Could very well be, it won't run from MagiC either. Only runs from TOS.
It's a commercial star database program, coming from Germany. On MagiC you
get a "69 fault" message. Running N.AES it displayed the starting screen
and it took me some time to find out it didn't go beyond that. Then it
appeared that it hadn't loaded at all, after a screen clearup.

Could it be some probs are caused by
qsbchars/cqsbchars/mpipesize/sstacksize settings?

Katherine, I think I've explained more than once it IS a monospaced one,
NOT proportional. I think I told Jo-Even I don't like prop fonts in my
AES=menu's etc. As I told Martin already, it doesn't have problems all the
time: some apps display OK, others don't.

Again, it's a commercial german starbase program. Won't run from MagiC
either, so it could very well be a "schweineprogramm"...

Hello atarians,

Does anyone know where I can get a demo of Cubase Audio Falcon? I already have Logic Audio, Audio Tracker, Edit Track, and a few other similar demo/shareware things, and I don't know what's wrong with me, but now I'm curious about CAF. ;-) I've already tried the Steinberg ftp sites in USA and Germany, and got some other items, but not what I'm looking for. And what's the deal with MROS?? Do you need to put it in the Auto folder, or what? Is it necessary? It doesn't have a file extension on it. Any help appreciated..... thanks.

Hello Martin,

t> Haha, nice try. I see we meet again:-)
Sorry, I was bored about this stupid OS war as it grew. As I mentioned very
early, an OS war is the last thing we could afford. There are two sligthly

different types of Atari compatible OS now with reasons (and users) for both.
IMHO everyone has to accept that and should look into the future instead of
mumbling "they are wrong, we are right".

t> N.AES doesn't run on Mac's and pc's, we both know that.
So "every" is not quite correct? ;-)

But to get serious again: No, I don't (and why should I? MultiTOS *is* working under emulation)! I'd like to see N.AES, but it has to run (at least)
under an emulation. Is this not possible?

t> He wasn't talking about Atari-emulators but about *real Atari machines.*
OK, but I think about machines which run Atari software at a competetive speed, regardless whether they are "real" (that doesn't matter anyway - IMHO.
Most important is the fact how fast and good a user can work with his Atari
software).

t> Now, we both know that with these machines N.AES runs very nice which -and
t> you know that also- can't be said of some other multitasking systems.
Sorry again, but *I* don't know! But I *really* would like to see it!! And if
it isn't able to run under an emulation (or even better, to go native like

TOS2WIN for example) then I can't. :-(

If it is possible, I would like to check it (at least to see, whether my own
software works - even if I wouldn't use it as my standard OS, I think it is
important - or at least "nice" - to check programs on it if a big number of
other users has it).

t> >URL for downloading a (demo-)version?
t> AFAIK there isn't one.
:-((Should be changed!

Greetings, Oliver

I know, but that has nothing to do with long filenames ;-) It would
indeed be nice to get Geneva stable under MiNT, as it's a very nice,
fast, compatible and stable OS.

760. Falcon for sale

Newsgroup: comp.sys.atari.st
Date: 1999-01-10 00:00:00 UTC
From: bsummer@delphi.com
Message-ID: <BVWXRzC.bsummer@delphi.com>
Source record: 86572

Atari Falcon For Sale:

Atari Falcon with 84 meg internal HD,14 megs of RAM,
math co-processor installed, and RGB,VGA monitor adapters,
with manual and box. HD is loaded with all ORIGINAL
Falcon software, inc. Atariworks, plus much more.
Price in USA $650.00 plus shipping/COD.

I also have the external TOAD Syquest 88/44 hard drive,
which was a perfect complement for backing up internal
HD. The Syquest will write to 88 meg carts, and read 44
also.It comes with cable, and 7 - 88 meg carts.
There's a 14.4 ext. modem if needed.
The price of the Falcon and external HD stuff is
$775.00 plus shipping in USA/COD.

If there is anyone in the NYC area, that would be interested
in picking up the Atari Falcon, instead of mailing it, I will include
an Atari SC1224 monitor in excellent working order, for
free.

If interested, please leave Email for Barry Summer at:
bsummer@delphi.com

Happy holidays, everyone!!
Barry

761. software for sale

Atari software for sale:

Here is a huge grab bag of ORIGINAL Atari software.
I believe only 2 or 3 are Falcon Specific. All have docs unless
specified otherwise.
Over 15 programs/games for $50.00, incl. shipping in U.S.A.

Diamond Edge
Diamond Back 3
ICD-Pro Utilities
Image Copy 2
Stalker 3
Word Writer ST
Compo C-Font
Cyber texture
Certificate Maker
DEluxe Paint
View II
Awesome Arcade Pack(Xenon,Blastaball,Sidewinder)
ANM LINK-Falcon
Pinball Dreams-Falcon

These 2 have no docs: Degas Elite and Gauntlet 2.

I really don't want to mail things separately, so I've made the price
really low.
If interested leave e-mail for Barry Summer at:
bsummer@delphi.com

THank you!!

:-)

If he is confident he could also look around the PSU on the main board. Many of these are made with a jumper to select full or half-wave rectification in the primary circuit so that they can be easily chaged between the 220/115v standards.

Thanks for that.I downloaded it and installed it.I am now faced with
another problem that when I click on edit in Okami.I write my message
and save it and a dialog comes up for pgpshell.I put in my password,
click on sign and pgp does its stuff.When pgp is finished an error
message comes up saying error merging file.I set it up for Newsie as
well but I get the same results.

Any ideas?

I remember that ATY and others had that gizmo to plug an IMB keyboard into your 1040/Falcon. Does it work with the Mega STe/TT?

It is a shame to see one old Mega ST after another cannibalized to keep another TT alive, because of those stupid membrane switches.

Opinions please.

It's definitely on the ATARI Gold CD produced by FALKE-Verlag in Germany, but sold by 16/32 in the UK.

It's one of the few games I play on my Falcon and it doesn't clash with MagiC and Nemesis either!

:-)

Great fun!

This does seem to be a solid piece of kit, with only the price of the non-standard extra memory hanging over it. Bit like the early Marpet memory upgrades in that respect. Worth buying tho' I think.

Hi Roger,

Back in the high days of the BBS network, the Fido FAQ text contained a very similar mod to the 4040. The main difference was that the mod could be switched in and out under software control which has obvious advantages to anyone who, like me, will always forget to operate switches!

I had a utility programmed for me that would switch the port speed and run ST-Fax, restoring the port on exit - but ITMT I got this Falcon so the opportunity passed. Plus I chickened out installing the speeder!

Ah, memories-R-us! ;-))

About the only way to find out would be to use an ohmmeter,
inserting/removing disks with various combos of HD and WP holes and work out
a truth table.

>The resistor that I need to desolder in the back is extremely small,
>perhaps 2 mm. What is the best way to remove it to the DSO pad without
>messing everthing up?

I managed to unsolder some surface mount resistors by heating first one and
then the other end whilst simultaneously pushing against the side with a
small screwdriver.

If it's only a jumper you could replace it by a solder blob or short piece
of wire.

Quoting Mike Harvey

<<Al, have you made a desision on weather your reopening the Computer Dungeon or not? Where in Fl are you know. I'm in Jacksonville >>

Hi Mike!

Hope everything is going well with you!

Haven't really made up my mind yet on reopening. Have started to inventory the remaining stock I brought with me to Florida and put some things together. I'm located in Tampa, by the way.

Whether I reopen or not depends on a few factors, but the main one would be how much of a demand there is for the Dungeon. Running even a home based business takes a significant amount of capital for such things as phone lines, credit card machine accounts, UPS accounts, paper and office supplies, products to sell, etc. etc. It also take a LOT of time. But if there were sufficent demand for the products and services we offered and if sales allowed me to pay the business bills each month, I could be pursuaded. Running the Dungeon was always one of the most enjoyable things I ever did and I do miss it.

On the other hand, the remaining Atari retailers (such as Systems for Tomorrow and Chro-Magic) are doing a FANTASTIC job of providing all the new products and services that Atari users want/need/ request and with their excellent track record there just might not be any need for another business like the Dungeon.

Maybe I'll just put up a support website with info, links, and files that Atari users might want/need and include a "Garage Sale" type listing for my remaining inventory.

Time will tell, Mike. Thanks for asking and all your past support.

>and Germany, and got some other items, but not what I'm looking for. And
>what's the deal with MROS?? Do you need to put it in the Auto folder, or
>what? Is it necessary? It doesn't have a file extension on it. Any help
>appreciated..... thanks.

There aren't any demo versions of CAF available. The only demo versions
which have been released from Steinberg are for PC and Mac :(If you've
tried a "demo" version that didn't work, you've tried a pirated copy...
(which was poorly pirated anyway...)
Steinberg's FTP-site contains an upgrade for those who don't have CAF 2.06
and you'll need the cartridge that's shipped with the original program if
you want to be able to run it.
Is there really a demo version of Logic Audio around? I'd like to have a
look at it then, so could you please give me the FTP-site? I'd like to try
it, to see why most people (me included) have chosen CAF instead... ;)
MROS is Steinberg's operating system, especially designed for music (Midi
Realtime Operating System) and is an essential part of Cubase.

->paths, and if so, rename it to uud.ttx. If it still bombs with
->UUencoded, then send me a copy of the email or article.
->
->John

Hi John! Thanks for the reply. Well, UUencoded files work fine. I've got both UUD.TTP and MUNPACK.TTP disabled (.TTX). If I enable MUNPACK.TTP in my Newsie/work directory, it will correctly unpack the -1st- MIME file I try, but then, it interferes with Newsie in some odd way. After that first MIME file, it won't let me even d/l another file until I quit Newsie and restart it. (this is online). It shows the "0 bytes" marker in the window bar, but doesn't ever start.

Again, UUencoded files handled by Newsie internally are fine. Next MIME message I get, I'll forward it to you. (BTW, it does this on all MIME files I've tried-not just 1) Thanks again. ;-)

BTW, I'm using a Nemesized Falcon, 14 megs, running N.aes/Mint/Thing...

On 6 Jan 1999 18:12:21 , Chris Cracknell wrote:
>I thought it would be nice to hear what everyone feels were the top 10
>Atari ST videogames.

I'll suggest more than ten, and in no particular order.

Prensorium, Shocker, Oxyd

I call these puzzle games. Are there others like these? I don't have the manual to Shocker or Oxyd so can't go very far into them. I think both are priced too high. They would have sold a lot more copies if they had a more reasonable price. Anyone want to sell me their Oxyd or Shocker book?

Prensorium is a great shareware game, and a real challenge. I registered it, and got the levels designer though it was so complex I haven't managed to create any new levels, yet.

More favorites:
Hector (attack of the mutant tomatos)
Kid GP, Dark Pearl, Kong (Dave Munsie classics)
Skystrike
Cudlee (Cudlee's Quest)
STrabble (my wife's favorite)
Drachen (a perpetual contest with my wife for best time on this)

Two Player Games:

Bubble Bobble (requires cooperation)
Midi-Maze (an ST Classic great)
MAZ (a great race to the finish line)
SquareOff (anothe Munsie classic)
COPNROB (kids love this one)
Marble Madness

Mr.Dash, a Boulder Dash type game. I tried to register but my mail was returned. It's from Germany, and the author is Paul Dehli. Does anyone know how to get in touch with Paul Dehli? Does anyone have a registered copy of Mr.Dash they would sell? The unregistered version allows for designing your own levels, but you can't save them.

Me too.

:)

Glad I'm not the only one. It quits for me when I run the mouse over the right-side window with the filenames in it, at the bottom. An earlier version ran fine, although I gave up using it. Now that I have NVDI I want to try it again.

Well here's another top ten that probably won't surprise.

1. Frontier Elite 2. I was not disapointed with this great game but would have prefered less realistic space mathmatics. I wish he'd kept to elite type movement. Landing on one of the moons of Saturn and watching Satrun rise on the horizon is still a great magical computer moment which I won't forget.

2. Elite. Nice conversion although again a few black marks. Still fantastic space battles.

3. Jimmy Whites Snooker. I'm still amazed at how good the 3d engine and sound effects are. No matter how good computers get I don't think I'll ever have to buy another snooker game.

From here on in no particular order.

4. Archer Macleans Pool. Sorry about this but I love this too even though its similar to above.

5. North and South. I tend to dislike french games as they tend to be more impressive than playable. This one isn't that impressive but its fantastically playable.

6. Prince of Persia. A great combination of american design and decent french coding. One of the best Persia conversions. Better than Amiga anyway.

7. R Type. After seeing so many hopeless sideway scrolling sh/ups on the ST I was pleasently surprised by this great conversion.

8. Buggy Boy. One of the few 3D race games on the ST worth playing.

9. Supercars 2. As nice as it is its still pretty poor compared to the Amiga version.

10. Megalomania. Still the best god type game for me and quite funny too.

11. The above reminded me that Cannon Fodder should be in here too.

theres probably loads of great games I've forgotten.

Hi

b> I can't get ST-Guide to work well. It loads from an ACCS folder
b> (under Magic 5.04) and always tries to find the HYP in that same
b> folder. I have set a path for these HYP-files in STGUIDE.INF but
b> that clearly has no effect. If another program calls ST-Guide things
b> go wrong in the same way. Any help would be appreciated, thanks,
b> Joost.

This is my Inf File mate, and that works OK, your welcome to use it to try
and get yours working mate.

Bfn Ste

```
# ========================================================================
# Please edit this ST-Guide INF file to your requirements
# ========================================================================
#
# Read this!
# This file can be edited in any ASCII text editor (eg Everest)
# If you experience any problems with ST-Guide try removing
# ST-GUIDE.INF altogether. ST-Guide then uses its internal defaults.
# If the problem goes away you'll know something is wrong with your
# ST-GUIDE.INF file.
# This file is configured by default to run from Drive C: but anyone
# running a floppy based system can simply change each occurence of
# C: to A:
# By default ST-Guide looks in the root directory of your boot drive
# for a 'GUIDES' folder which can be used to store all your 'HYP and
# 'REF' files.
# Lines preceded with a '#' symbol (like this one) are comments and
# ignored by ST-Guide.
#
#
# ST-Guide options:
# -----------------
# Default search path, where ST-Guide looks for 'HYP' hypertexts:
PATHS=E:\STGUIDE.14E\GUIDES
#
# Default directory ST-Guide opens when calling the File Selector.
# The Hypertext ComPiler (HCP) also compiles to this path:
HYPFOLD=E:\STGUIDE.14E\GUIDES\
#
# A list of file extenders and paths to external viewers may follow:
C=
```

```
IMG=C:\1STGUIDE.ACC
#
# An external viewer, which must be memory resident can be used to
# display unknown file types:
EXTVIEW=NOTICE
#
# The hypertext file to be loaded via the ST-Guide 'Catalog' option or
# when ST-Guide is started without parameters:
HYPTOP=E:\STGUIDE.14E\GUIDES\CATALOG.HYP
#
# The file used to find references:
REF=E:\STGUIDE.14E\GUIDES\ALL.REF
#
# ST-Guide can use GDOS screen fonts if loaded, the code determines the
# font used. Refer to main documentation for syntax details:
#FONT=98,9
FONT=1,10
#
# The following three variables are only relevant in colour resolutions
# and are ignored in monochrome resolutions.
# TXTCOLOR Displays text in the specified colour.
# REFCOLOR Displays references in the specified colour using the
# normal typestyle (NOT bold and underlined).
# BCKCOLOR Background colour for ST-Guide windows.
#
# Default colours (Note! Your system may change these values!):
# 0=White 1=Black 2=Red 3=Green
# 4=Blue 5=Cyan 6=Yellow 7=Magenta
# 8=Grey 9=Dark grey 10=Dark red 11=Dark green
# 12=Dark blue 13=Dark cyan 14=Dark yellow 15=Dark magenta
TXTCOLOR=2
REFCOLOR=3
#BCKCOLOR=8
#
# If this option is active (the value is irrelevant) a right mouse key
# click is interpreted as 'Retrace'.
#RIGHTBACK=
#
# If this variable is active, clicking on 'normal' text does not cause
# ST-Guide to search for references.
#REFONLY=
#
# HCP is used to compile STG files into HYP files. STool uses this entry
# to find HCP and compile:

you want to boot off the Quantum prodrive?!
Once you have configured and installed hd driver, attempt reboot.
if booting unsuccessful form external Quantum, boot from floppy again,
start hdutil, and open hddriver.sys on your c:\ partition.
guaranteed not be the way you set it up!
check all settings and change to correct ones, save(install) on boot
disk again (overwriting previous)
reboot should now work.
hope this helps
ken

Well, why don't you get Pressworks or Green Street Publisher? These are
the successors to Timeworks and import 1st Word stuff perfectly.

Go to www.gstsoft.com for details.

807. Small STinG network

Newsgroup: comp.sys.atari.st
Date: 1999-01-11 00:00:00 UTC
From: Torbj|rn Gild} <d98gilda@dtek.chalmers.se>
Message-ID: <Pine.SOL.3.96.990111230815.9046B-100000@kleise.dtek.chalmers.se>
Source record: 86419

Hi!

I have just recently got myself another falcon, so now I have two. I thought it would be nice to connect them into some sort of network, so I tried using STinG for that. It`s just that I`m not exactly a pro when it comes to networks, and as yet I haven`t succeeded. I use a null modem cable connected to Modem 2. The cable works perfectly in Connect 2.46, but when trying it with STinG nothing happens when I try to ping the other computer. The ROUTE.TAB file, on both computers, looks like this:

1.1.2.0 255.255.255.0 Modem 2 0.0.0.0
0.0.0.0 0.0.0.0 Modem 2 0.0.0.0

One of the computers has its IP on Modem 2 set to 1.1.2.0, and the other has 1.1.2.1

At first I tried using a Centronics cable, that I built according to the instructions that come with ParallelCopy 3.01. The cable works perfectly together with ParallellCopy, so I had hoped that it would work with STinG too. Since I don`t know what the proper network settings should be like, I couldn`t determine wether the problem came from the cable or my settings. I therefore built a null modem cable also, but it still doesn`t work.

There is one difference when using the Centronics port instead of Modem 2: When viewing the Statistics using the Dialer and when using Modem 2, I noticed that packets are constantly being sent between the two computers. But one of the computers keeps dropping the packets, and the other computer doesn`t get back any packets. When using the Centronics port instead, no packets are sent by any of the computers.

Of course I change `Modem 2` to `Centronics` on the first line in the ROUTE.TAB file, when I use the parallel port.

Regards
Torbjorn

I'd like to see that, too. Unfortunately, I know of no such program for the
ST. If any skilled programmers would be interested, the Amiga PlayFKiss
distribution comes with source code in the E programming language, which might
provide some pointers.

```
According to an old C&VG, Area 88 was to be released for the ST under the name
of "U.N. Squadron", but that's the only one I can come up with.
If you just want some cute anime graphics, Rodland might be available in an
Atari conversion as well.

Hi Derryck,

DC> >Here's my practical experience...
DC>
DC> And valuable too - looks like you've got some work to do over the weekend -
DC> it's way too cold, wet and windy to do anything else than work over a warm
DC> ST! :-))

Well, as it turned out, Sunday was a lovely day, and of course other
things came up over the weekend :-) But, I managed to do a fair
amount of checking...

DC> >One thing to check while I do is what difference in performance I _do_
DC> >get, rather than what I _think_ I get. I'll be sure to be thorough...
DC>
DC> OK, don't forget to pass on your conclusions!

OK, then. I dunno where I got that figure of ~2500cps from <shrug>,
but broadly speaking, whatever I did to my setup - changing FastRAM
flags and all that - I get the same results (in CPS):

| Port upgrade
| Off | On
------+-------+-------
68000 | ~1800 | ~3100
68020 | ~1800 | ~3100

This is d/l'ing a 350K .zip from my web-site, so as to minimise 'net
latency (all within Zetnet). And running under MagiC 6, STinG, CAB
2.7demo, OVL 1.3015B, with FastRAM in use whichever processor was
active.

So, the Veloce+ doesn't do anything for the port upgrade directly, but
of course, it _does_ make the whole rest of the system that much
faster :-) I'd say that when you're doing several on-line things at
once, say mail & news d/l, and ftp or www too, is where the Veloce+
wins...

The strange thing I've found, to do with the 'net speed problem I've
had under MagiC 6, is that enabling background DMA causes it: the same
CAB d/l will slow to ~900cps, with looong hesitations, and STinG's

stats shows a lot of dropped data on modem1 after disconnecting :-/

This is with CBHD 5.02. But the _exact same_ setup, just using MagiC 4
instead, works fine with background DMA enabled <frown & shrug>.

Anyroad, I'm still not finished testing. But it'll have to wait until
at least the end of the week...

DC> This does seem to be a solid piece of kit, with only the price of the
DC> non-standard extra memory hanging over it. Bit like the early Marpet memory

Well, I did my testing (see other post for results) with a .zip on my
web-site, to try and get the shortest route over the internet that I
could <g> as well.

I didn't think of timing the transfer (just relied on CAB's cps
reporting), but the results were fairly consistent over several d/l's
for each setting. The file came through pretty much non-stop every
time, so go figure from that ;-)

Well, I'll do the tests again, with stopwatch to hand, later in the
week...

816. FS: Atari Mega ST2 system

Newsgroup: comp.sys.atari.st
Date: 1999-01-11 00:00:00 UTC
From: legalrender@kinn.com
Message-ID: <369a879f.6363488@news.cortland.com>
Source record: 86428

Greetings!

Okay, so here's the deal. I auctioned my Atari Mega ST2 system off on eBay. Then the top four (yes, all four!) either flat out flaked out or had already purchased systems by the time I figured out that the first gut was a flake. Bad Karma! Because I want to avoid any more eBay charges, I am going to offer it here for a price substansially lower than the auction price - $125.00 or best. You pay the actual shipping costs to be calculated. It's all boxed up and ready to go. The system is:

Atari Mega ST2
Atari SM 124 Monitor
Keyboard, Mouse, power and connecting cords.

All in great shape, virtually no scratches, or blemishes. All works perfectly. No software (sorry, if I had some I'd probably keep it!). I don't know how to tell which version of TOS is on it or how much memory (I'm guessing 2 megs) but I'll be glad to try to answer any questions you have.

You can see a picture of it at:

Greetings!

Something which I have no use for but maybe you do!

Atari SMM804 Dot Matrix Graphics Printer Manual. Spiral bound, 117 pages, specs, pinouts, etc.. Perfect shape, with registration card and subscription offer card for Atari Explorer magazine (save 50%!).

If it's worth something to you, let me know! I need to clear stuff out for an upcoming move.

Thanks! Please reply by email or phone (before 8p PST)

Er, no. I put in the error checking code, just in case but I've not had
it display any error messages. I did get a few other errors while
debugging but that wasn't one of then. Anyway, have a look in your mail.
I've extended the error checking so it'll give a better idea about where
the failure is occuring.

I need the following goodies to complete my system:

a visual composition program (like Deluxe Music Construction Set or
something similar) that will work on a 520ST w/Tweety Board

an SF314 or equivalent DSDD FDD

ST keyboard

Please let me know if you've got any of these items and wish to part with
them.

Thanks!
Louis

820. Atari ST technical questions:

Newsgroup: comp.sys.atari.st
Date: 1999-01-11 00:00:00 UTC
From: Prince Corum <corum@sasquatch.com>
Message-ID: <77eo09$j35$1@news.sasquatch.com>
Source record: 86432

Any help would be much appreciated...

How can I tell what version of TOS I have on either of my old 520STs?

Does anyone know the difference between the Rev E and Rev H motherboards on the 520STm?

The sound chip on one of the STs has a strange modification done to it where a funny little red and black resistor has been draped across it. Is this a problem?

Can I upgrade either machine to 1MB or beyond without hacking the motherboard too badly?

I have a Tweety Board I would like to install on one of these machines and there are three RCA style outputs marked "A", "B" and "C". Why are there three for only STereo sound?

If anyone can answer any of these questions for me, I would greatly appreciate it.

Thanks 1,000,000!
Louis

The futuristic Dungeon Master in space.

Made by Anthony Crowther for Mindscape.

At first, you don not have any weapons, ammo or special devices for your four robots. Their experience is low, strenght etc. When fighting aliens, there is lots of them in different shapes, you get more and more skills. When you smash them down, at first, with your bare hands, they drop money on the floor, collect them and buy first knifes, swords, axes, pistols, shotguns to lasers and cannons. You have to buy ammos as well, there is a chinease salesman in special locations, that fix your droids body-parts etc.

Doors are often closed through the game, some aliens wears clipboards that opens them up. You also buy heavier and heavier armor for your droids, and so on. A really timeconsuming game.

You travel in space between the level planets in a special order with help of planet probes that you collect in each level. Devices, such as radar, mappers, body scans etc helps your droids go further through the game. You have to buy them as well. There is powerpoints in some places that you use to power up your droids or fill reacharger batteries with.

Just, like AtariMad wrote.

Well, a pre-pre Wolfenstein 3D look-alike game...

NEWSie uses Munpack.ttp to decode base64 attachments. But can use
either uud.ttp or an internal module for UUencoded. Does the hang
occur on base64 only? If so, it is probably munpack.ttp, although it
has never caused any problems on my Falcon. If it hangs on
UUdecoding, verify if UUD.TTP exists in either the work or program
paths, and if so, rename it to uud.ttx. If it still bombs with
UUencoded, then send me a copy of the email or article.

I did try the UUencoding, and it only worked for the first time.
The problem was using the frepoen() command. I have now changed to a
standard fopen() and can generate mutliple uuencoded attachments in a
single run of the program. Sorry for the lack of detection of this
kind of thing. I guess I don't send a lot of email with attachments.

The change is in 0.94 (not beta tested version). I will be available
in a week of so.

Check out the Quick FAQ.

You need a SCSI host adapter. You can't just build a cable, because this
adapter has some active electronics inside with a GAL chip that has to
be programmed. You can buy one for 76 Euros (wow!) at any Atari dealer.

Since you're in Austria, you might want to look to the german dealers.
There is still
quite a lot of support for the Atari in Germany. The Quick FAQ has a few
links to dealers.

> sony floppy drive but find three leads in my case. Do I short them all,
> or just a pair, if so which ones?

I just had a look during the weekend, so for all interested, here are
the changes you need to perform to a Mitsumi D359T6 floppy drive to use
it on an Atari (ST/TT/Falcon). The Mitsumi drive was the only one I
could find nowadays. It seems to be the cheapest and most widespread
floppy drive used nowadays in most OEM, brandless and homebuilt PCs.

To change the drive ID, this unit has no jumpers, however, on the
connector PCB you'll find a small area with 3 rows of 4 tiny solderpads.
You have to make 2 solder bridges, like this (viewed with the connector
to the bottom and the front of the drive facing up)

```
o o o o
o o=o o
o o o=o
```

With this, the drive will be detected by the Atari, but you may
experience problems with the Media change: when you swap disks, the
Atari can ignore the swap, and writes to the new disk using FAT
information of the old disk. This usually corrupts all the data on the
disk, and makes it unrecoverable.

The enable the media change detect, you can solder together 2 pins of
the write protect/media change switch (top left of the drive, marked WP
and MC). Bridge the MC and middle pins like this:

```
|_____|
W | | | M
P | |=| C
```

I haven't tested that part yet, but read a post from somebody claiming
that this corrects the media change bug. I still use the fmc.prg in the
AUTO folder as a precaution.

If you want to do the HD mod, then you'll find that pin 2 of the mitsumi
connector does not output +5V when a HD disk is inserted, as it should.
A way around this, is to run a wire directly from the HD detect switch
to pin 2 of the connector. The HD switch is the one opposite to the
WP/MC switch, and has a pin marked HD. You should solder one end of the

wire to this pin, and the other to the connector PCB, where the pin 2 is soldered to the board.

I suspect that the HD detect and Media Change settings can probably be changed from the "4x3 solderpads" area, but I was unable to find a way to do so. Maybe someone else has some better information.

> could put a 68010 in this machine?

Have a look at the Quick FAQ.

IMO, there's no point in upgrading an old 520ST. To upgrade the RAM you need a memory expansion board (at least USD70), which would probably cost more that to get a cheap second hand STE, that you can upgrade to 4Mb with simms, and has better hardware, a better TOS version, stereo sound, etc...

For a SCSI hard drive, you need a SCSI host adapter.

Never heard of an 010 upgrade, but there was an 020 and 030 accelerator board. Both were expensive.

I'd say that just getting a Mega STE or a Falcon would probably be cheaper than to fully upgrade an old 520ST.

Check if your MAGIX.INF file contains a line with the _TSL keyword. This
line has to be deleted. (Also refer to the MagiC or HDDRIVER README for
an explanation.)

Prensorium, Shocker, Oxyd

I call these puzzle games. Are there others like these? I don't have the manual to Shocker or Oxyd so can't go very far into them. I think both are priced too high. They would have sold a lot more copies if they had a more reasonable price. Anyone want to sell me their Oxyd or Shocker book?

Prensorium is a great shareware game, and a real challenge. I registered it, and got the levels designer though it was so complex I haven't managed to create any new levels, yet.

More favorites:
Hector (attack of the mutant tomatos)
Kid GP, Dark Pearl, Kong (Dave Munsie classics)
Skystrike
Cudlee (Cudlee's Quest)
STrabble (my wife's favorite)
Drachen (a perpetual contest with my wife for best time on this)

Two Player Games:

Bubble Bobble (requires cooperation)
Midi-Maze (an ST Classic great)
MAZ (a great race to the finish line)
SquareOff (anothe Munsie classic)
COPNROB (kids love this one)
Marble Madness

Mr.Dash, a Boulder Dash type game. I tried to register but my mail was returned. It's from Germany, and the author is Paul Dehli. Does anyone know how to get in touch with Paul Dehli? Does anyone have a registered copy of Mr.Dash they would sell? The unregistered version allows for designing your own levels, but you can't save them.

Yes, Titan once sold a STE->Megabus adapter that allowed any Megabus-card to be installed in a STE. The adapter is pretty hard (impossible?) to find nowadays, but a Megabus-card can be fitted in a STE with a lot of soldering.

Btw. if anybody has a working Reflex graphics-card for sale I'm very interested...

Shame as the higher colour depth would have been ideal for use with
the likes of DA-Picture, CAB, etc.

We have IBM PC's in work with S3 Virge on board which handle
1280x1024x65536 no problem (though it may be the S3 Virge 64+).

<>Cheers, Charles.

Hi Charles,
Thanks for your reply. I have MUNPACK.TTP and UUD.TTP in
the Work directory and Newsie has no problem decoding UUD and Mime
attachments. However recently I've received three Base-64 attachments
and when I click on 'extract' in the usual way a dialogue comes up

with something like 'looking for binary', it evidently can't find it
as the dialogue go's leaving the attachment untouched. Thats why
I've had to do it manually. Who knows I might not receive any more
of those and its no great problem to decode them manually now I know
I can use Munpack.
Cheers
Mike

> things cost now anyway?

A 16Mb SIMM will only give you a 14Mb machine, because of the way the
RAM is handled. To go beyond that, you would need a Fast Ram board.

No idea where to find one, but I would try Wizztronics, Best
electronics, Bravo Sierra, B&C computervision...

Check out the Quick FAQ. There's a program called sysinfo.prg that will
do just that. I would estimate them to be TOS 1.0 if they are not STFs.

> Does anyone know the difference between the Rev E and Rev H motherboards on
> the 520STm?

Probably some manufacturing differences. They are probably functionally
identical. The company where I work does this all the time on electronic
boards, just because a component grows obsolete or to reduce production
costs or to increase reliability.

>
> The sound chip on one of the STs has a strange modification done to it where

No idea on this one. maybe something to do with the tweety board ?

>
> Can I upgrade either machine to 1MB or beyond without hacking the
> motherboard too badly?

Yes, with an upgrade board. These only require a few lines to be
soldered.

Seeing your other post where you're looking for an external diskdrive,
plus a keyboard, plus a ram upgrade, I would say get a second hand STE,
it would be cheaper/more upgradeable/generally better than an old STm.

>
> I have a Tweety Board I would like to install on one of these machines and

> Could anyone tell me some more about it, what was new?

TOS 4.92 was the beta version of TOS 5.0 that was distributed to
developpers. It was actually meant to go into the Falcon040, or whatever
the Falcon's semi-pro brother was meant to be. It was never publically
released but leaked out onto a few FTP servers. It's very buggy and very
unstable. It only runs on the Falcon and boots from floppy IIRC.

ftp.lip6.fr used to carry it, but it can't be downloaded anymore, since
its distribution is illegal.

I beleive it contained the AES 4.10 that ended up in the KGMD MiNT
distribution, so you can install that to see what it looks like. Not
very different from TOS 4.0

864. Searching for ET4000 Driver >2.61

Newsgroup: comp.sys.atari.st
Date: 1999-01-12 00:00:00 UTC
From: LE COAT Francois <lecoat@ief.u-psud.fr>
Message-ID: <369B7423.4E2C5664@ief.u-psud.fr>
Source record: 86362

Hello,

I have an HADES 060. In fact it's the first that was bought in France.
I have an ET4000 graphic card. Unfortunatly my Graphic card driver
date from june 1996 and is the 2.61 version. I heard that the latest
release is 2.67. I thought that Fredi Aswanden would help me, and he
did, but he told me to fax to Mr Huber from COMPUTERINSEL from whom
I had no reply. My ET4000 is a PCI card with 1Mb of video RAM. I tried
various driver from friends that have HADES, but it's not working.
I tried even NOVA/ET4000 TT driver with no result. Maybe someone
could help me ... I don't know : John Mc Loud who wrote the
usefull CPX for NOVA configuration, or someone else.
If anyone has any idea about how to solve my problem, it would
be nice. The 2.61 is quite buggy, and I can't make parts of
my Eureka program work properly.
Thanks in advance ...

Regards,

It worked ok on my Falcon if started in the ST low or high
compatibility mode.

It did *work*, but it crashed and locked very easily. This was with
the Geneva 006 demo though, perhaps the full version is better?

It's certainly not the cab.ovl for MiNT. The one you mentioned is for
STik/STing only. However this cab.ovl can be used with MiNT/MiNTnet if you
use Gluestik.
The latest cab-for-mint.ovl can be found on the Belgian ftp-site

193.190.205.13 atari/internet/mintnet_ovl/ssl_18404.ovl (Secure Sockets layer)
/ovl18404.tgz (no SSL)

Hope this help
Martin

It was certainly not slower, only the mintnet part caused some trouble.
What the problem is I can't say but the time I tested it Geneva crashed
from time to time. Some other users had the same experience.
It is usable but that's it. Jo Vandeweghe has used (and is still using it
from time to time) to get on the Net.

And I wished I had a newer driver for my ET6000 card. It's also version
2.61 and I also have some troubles with it.

However if you've some money to spend you better wait a few weeks and buy
the new Hades graphic card based on the ATI Rage Pro. It can have up to 8
MB RAM. MW Electronics (Germany) is working on it. It's believed that the
card and driver should be ready this month but for the moment I don't have
an idea of the price.

The latest release is indeed 2.67. I don't think the Hades drivers and the
normal Computerinsel drivers are compatible, at least not the ET 6000.
The ET 6000 is made by Medusa System and AFAIK only Medusa System is able
to help. BTW which e-mail address have you used to reach Fredi? The one
I've seems to be invalid (medusa@logon.ch)

BTW: I've here a driver for the ET 4000 but I don't know which version. Do
you want it?

>If anyone has any idea about how to solve my problem, it would
>be nice. The 2.61 is quite buggy, and I can't make parts of
>my Eureka program work properly.

What is the problem? My problem was initialy that when I viweed animated
gif with Cab my system (32 MB) ran out of memory within a few minutes.
I then followed the advise of a Swede who told me how to patch sta_vdi. I
only had to edit sta_di.prg with a file-editor. I had to replace the
'EdDI' entry into 'EdDY'. This solved the memory consumption problem
indeed but the display of the animated gif's was from then on flickery but
I could live with that.
Recently I discovered however that some graphic prg's like Smurf, Papillon
v3.01 and Bellini had some problem with the patch.
Bellini doens't start at all. It complains that I can't find 'EdDI' and
quits. Smurf and Papillon runs normal but if I us then in 65k or 24b color

mode the display of the pictures is wrong. Smurf shows then in a deep blue
wereas Papillon displays the pictures with stripes.
So I changed sta_vdi back to its originally state. I expected to have that
memory problem again but no this was gone. Initially I thought the problem
was definitively gone but a few days ago I discover accidentely that
when Cab displayed an animated gif my harddisk was working as long as the
animated gif was on screen. If I let that gif one hour on screen my
harddisk works one hour. Not quite healty I suppose.

Ohhhh Martin what you're talking about made me amazed because I have
to say I have the same problem here but only when using MagiC! ....
A big mystery is coming .....
Of course you know I'm using the latest 2.67 STA_VDI for Mach32 ...

I will try under other configurations and will come back to give my
conclusions ..... wait a minute boys ...

.....time.....

My conclusion is very strange because I cannot give any ;)

-under single TOS = no continuous access to hard disk
-under MagiC! = continuous hard disk access
-under Geneva = continuous hard disk access
-under MiNTnet/Geneva = continuous hard disk access

Most strange, by installing the excellent shareware SPICA from
Gordon Faika, I can see which partition is continuously accessed
and believe me or not it's not the partition where the html document
is laying which is accessed, it's partition "C" !!!!!

Let's try by yourself with Spica, you can download it from:
http://atari-computer.com/rgfaika/
Spica is a kind of drive access shower (replacement for Ledpanel which
didn't support graphic cards ...)

Mario Becroft also has a adaptor cable that allows you to use a AT PC
keyboard AND a PC serial mouse/tablet/trackball, with joystick
extensions.
see http://www.pl.net/~mario/

If you get this running please report back to the group. I would love to get
a STinG based network running on my Falcon and STe. Apparently, you can also
use STinG to let one modem and internet connection work for two computers
(this has a name, but I forgot what it was). I'll be trying this eventually
too.

>I did ;-) The next version of SERIAL.STX will very likely have CHAP.
>
```

This is as I wrote before splendid or more "smashing good news",
the programmer behind this module, do have very good skills.

What I understand is that CHAP uses encrytion to verify a user
with an ISP. DES or/and RSA Security Inc MD5 or is it RC4.
What I want to say is that we all should be very proud to have this
man (and you) in the Atari-scene.

I also understand that a ISP can? use SPAP (Shiva) or verify a user
without encrytion if a client do not support or have functions to
encrypt, maybe this also is a possible way to use CHAP?

Best Regards

Mille Babic

Source record: 86385

Here I am to say that finally I've managed it to work tought still preliminary.

You can run NOS as always and at any time use some new commands:

cab directory: to specify where CAB.APP can be found
cab head <url>: to get header informations on a url
cab get <url> <filename>: to get and url and save it to file !!!
cab start: !!!!!!!!!!!!!! yes this starts the browser ad then you can navigate, cache is supported, POST is still NOT supported, sorry, no search engines !

I will find time to set up archives and 68k + 68030 version and then put online in few days I hope, but give me a mail if interested !!!!!!

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

True. Once you've had a shufti could you pick out a few likely ones and we
can take it from there?

> >Another thought: I don't currently own Gemtrade, but if I were to buy a

Figures: Ruftrade was about the best prior to Gemtrade and the results were
distinctly iffy. Probably best forgetting that idea then.

I did a test run with a2html.ttp on a couple of files and it's quite good:
you'd just need to add navigation links at the end of each file. It will
also do an entire directory at a time. The main point in doing it really is

to cope with accents etc, as the original files have Atari encoding so tend to look dodgy if you aren't using the Atari character set to view them. Each page could include a link to the original text for those who want the original encoding scheme, thus keeping everyone happy, I guess/hope!

However it would be useful to have something to tack a set of navigation links into the end of each file and possibly insert some stuff in the header (I'm thinking BODY attributes to make the background white instead of grey).

The screen update is absolutely terrible without NVDI :(
The version I use is 4.1 - I haven't upgraded to 4.11.
I've never had any problems with NVDI and I've run versions 2.5, 3.01 and
now 4.1.
What's happening when you try to make it run?

>
> 1.1.2.0 255.255.255.0 Modem 2 0.0.0.0

Delete this one. As long as the machine hasn't got any second and third
connection, the default route is enough. You will need such a line though
if you connect to the Internet too using a modem at another port, but only
on the modem machine.

> 0.0.0.0 0.0.0.0 Modem 2 0.0.0.0
>
> One of the computers has its IP on Modem 2 set to 1.1.2.0, and the other
> has 1.1.2.1

a) Do not use this network address ! It is owned by someone else ! Use the
free addresses (i.e. 10.x.y.z or 192.168.x.y)

b) Naughts and 255 as part of the IP address often have a special meaning.
Avoid them. A sensible start number as the first address in use is
192.168.1.1, not 192.168.1.0

> There is one difference when using the Centronics port instead of Modem 2:

> computer doesn`t get back any packets. When using the Centronics port
> instead, no packets are sent by any of the computers.

The public versions of the Centronics driver are not very good (they have
flaws). Use a serial cable for the moment.

Setting up a routing table is not enough, you need to configure the port
too. For serial ports, this includes setting baudrates etc. to the same
settings on each machine. Use CoNnect to check the connection. If that
works, set the ports to the same protocol (I suggest SLIP, no VJHC), give
them the IP address, and switch them active. If STinG as a whole is switched
active too (STinG Internals CPX), ping should work (at least if HSMODEM
runs before STinG in the AUTO folder).

Cheers Peter

One simple solution is simply to buy DD floppies. Dozens of stores have
them, including Viking Office Products, (http://www.vikingop.com) which I
believe has a UK outlet.

My turn!

1) RailRoad Tycoon! This one I still dream about! I love having to account for terrain, competitors, etc..

2) Civilization. One of the best strategy games ever.

3) Dungeon Master. A perfect adapatation of D&D, in my opinion. The computer took over the annoying bookkeeping and you could just let your mind play.

4) SunDog. Unusual and way ahead of its time.

5) Frontier Elite. A bit slower than SunDog, although much more complex.

6) Chaos Strikes Back. More Dungeon Master (got tired of running in circles, though)

7) Obsession. Very nice pinball. Not quite as interesting as Starball, but prettier.

8) Ishar (all 3).

9) Lure of the Temptress. I know many won't like this one, but I really got a kick out of having everyone in the game move about. A nice puzzler.

10) Sim City. Ever cover every single square of a city with a high score (and no cheating) to boot? I did.

Imo it'd probably be a good idea just to pull out a dozen or so
functions and see how it goes. Saves expending all that effort in case
the idea falls flat on its derriere. ;-)

>Another thought: I don't currently own Gemtrade, but if I were to buy a

>is the output likely to be too garbled to be worth the time and expense?

Not that I've used translators much but when I have it has usually
been for software instructions. Rarely does anything sensible result -
the more techie the doc, the worse the garbage.

>I have two major handicaps in this case: I don't know any German worth a
>damn and I'm not a programmer! So, before I dive in, are there any
>potential takers for this kind of thing or would I be wasting my time?

I don't know any German either but I have been known to code the odd
line or two. No doubt I could cobble together a cheap and cheerful
prog to help generate the html.

I have tried it and even managed to run it from hard disk without requiring
a floppy boot disk. It is , as Nicholas points out, buggy and unstable, and
therefore not recommended unless you enjoy using your reset button! :(

It did seem to run quicker than TOS 4.04 once I got it running but I never
got it to run long enough to appreciate the difference!

Hello Claes, thanks for your reply,
about 'CAF & NVDI' you wrote:
>What's happening when you try to make it run?
Well, Cubase Audio crashes after 5 or 10 minutes. I tried different
NVDI-configs but that makes little difference. Sometimes I think it
crashes when the auto-save starts but turning that off doesn't make
much of a difference. I also have an old NVDI 2.5 but does that run
on a Falcon?

> Could anyone tell me some more about it, what was new?

TOS 4.92 can be found on a few ftp sites and I once tried it out myself.
There are two versions around, one that boots the new OS from floppy and
the other can be installed onto hard disk. I can't remember where I
found it but perhaps you could search for tos492.lzh from www.filez.com

Yep you can and it's called IP Masquerading (a feature which is also offered
by Linux. I wonder if MiNTNet will ever support it). I use this feature quite
a lot myself although it is somewhat slow sharing a 14,400 modem. ;-)

I can't remember off of the top of my head exactly what I needed to do
to get this feature working, but if you are interested I can find out
and let you know.

I suppose that you'd have to bring out all the processor pins to connect
that card, easy enough on an ST but very tricky on the STe.

>Btw. if anybody has a working Reflex graphics-card for sale I'm very
>interested...

I sold mine a few years ago, I had it fitted inside a Lighthouse Tower -
again a lot of soldering to connect it to the STFM.

Needed a screen driver from the NVDI ET4000 version IIRC.

Blitter definitely recommended, can't recall whether it was compatible with
the ATSpeed accelerator (think it was).

Applications loads much faster, and most importantly, it is less of a memory
hog than TOS 4.04. I didn't really use much of it, just want to make sure that
my application runs on it.

Rgds
William

Your mouse has moved. Windows NT must be restarted for the
change to take effect. Reboot now? [OK]

The SCART standard contains both RGB and composite. The Atari monitor
only has RGB inputs. Therefore, if it doesn't work I suspect that the
Playstation only outputs composite for a TV, and no RGB.

I had the same problem a while back, trying to connect a VCR to an
SC1224.

It's pretty easy on an STE. Most STE's have a square socketed processor,
so you can plug a board onto it. That's how the TUS IDEal HD adapter
works.

Of course, for the older STE's with a square soldered 68K, it's more
tricky.

Just installed Magic 6 on my F030 (NVDI 5). I am booting with USA
Language and keyboard but end up with an English keyboard in Magic.
How do I change this back to USA. Nice upgrade but this is most
annoying. Is there somewhere a setting in the CNF file (or some
backdoor trick) ?. Anyone?
Thanks, clab@buffnet.net

933. Old bits-any good

Source record: 86271

Acquired some old computer bits that are to be scrapped.
Are these any good, at present I'm running a Falcon but will be
getting PC for video editing later.
It would be very nice if any of these can be used on the Falcon

2 internal harddrives 1988 quantam can't tell if they
are scussi or eide or what size ?
A high speed buffer with parallel and serial ins_outs.
An optical disk drive, is this an old type CD-rom
equivelent. It has a broken disk tray, are these
trays easy to get or is it not worth bothering
with.
AN old Cherry keyboard.
2 floppy drives, again can't see what size

Anybody wise to these bits.
Regards BILL

Just downloaded A-mail 1.1b from Atack's website:
http://www.pwp.cz/atack/index.html

I must say it looks very promising. It doesn't only work with Mintnet, but also with Sting! (then you have to download an extra socket though) I haven't really tested it to the bone yet (can you say that in English?), but it seems to be more stable on my system than MyMail.

Wow; now it's really tempting to try again to install mintnet :^)

> under anything else than MagiC?

Yep, NVDI 5.01 works perfect with MiNT/Naes over here... It's in my
auto folder directly after MiNT (no 'cd u:' in my mint.cnf). Wdialog
is started with copsload in Naes, but I need it in my auto folder
when I want to change to a >256 colour resolution. BTW I don't need
copsload to run Wdialog, when it's in my autofolder. I only do it
because Stic then gives an error message like 'Old AES'.

You may add freeMiNT 1.15.1-0.5/N.AES to your list.
It's indeed partition C. So the question is now what the hell is Cab
doing on my drive C and why? I thinks one should search for a bug or
feature in Cab 2.x. I did the same test with Cab 2.5 and 1.5. With v2.5 I
had the same problem. With v1.5 however the problem didn't occur.

Damn pico. Anyway, I have an edited version of the keytabl.sys
that I made with edhak. It handles the changes for normal and shift
status. I didn't check the control combo's etc as I never use them.

If you want it, it is on my web page on the products page.

It's nice indeed. I'm using it during quite some time now but only as test, not as my main mailreader. I do like Okami very much. Anyway during my tests I never could take aMail down, which can't be said of Mymail, at least not under MiNTnet. Mymail is on my system under MiNTnet unusable. However with STing it works reasonble well.

I case one can reach Atack's website, try the Belgian ftp-site 193.190.205.13 atari/incoming/internet/amail/am101b.lzh (MiNTnet version) /asock_st.lzh (STing socket)

Remember you need both if you want to use it under STing.

So I'm not the only one that's come to that conclusion. I got 30 DDs a
few years ago and only one lasted more than a few months. The one that
did last is still in use although I've had to reformat it because of a
few dodgy appearing over the last couple of months.

It's strange that all the unbranded discs I've collected over the years
don't have a problem yet these do, even though the Select ones got less
usage.

Playstation has RGB output, but not via RCA jacks. And as I know suplied
scart connector goes to them.Playstation has multi output connector on back
side, where are all required signals - RGB, composite (PAL or NTSC - it
depends from used CD), stereo audio and +5V.
Problem is find connector for it. Other problem is that Atari monitor
requires separate H and V-sync signals.
All in all, it is possible, but difficult.

The pins of the joystick socket may have come loose (i.e. the solder
has broken) where they join the board. It is possible to resolder
them after you strip the machine down.

Try to find Simon Poole`s keybord.prg. Edit the layout to whatever
your need.
Drop it in the /magic/start/ folder, and you can have any keyboard
layout you want.

I`m using Magic 6, a german version, with a danish keybord layout on
a GB machine.

Some other keyboard prg. might do the trick to?

>
Hi,

I've been trying their site last saturday and it wasn't available then. So
I fetched it tonite from the RMA site.
Installation no problem, it ran perfectly, did a quick testmail to myself,
all no probs. This was on Mintnet.
But: no selectable retrieval of mail??? All I get is "there are 3 mails
waiting for you", no details and AFAIK no selection of what to get and
what not.
Otherwise, looks very nice, works OK (haven't tried out all the options
but that will need some time).
It seems to be using the POP3 server by default, or is that only when you
fill in the POP3 details?
And, like Karsten sez: to try out all the features, there will be some
time involved.

But, promising, to say at least!

959. Mintnet and Naes

Newsgroup: comp.sys.atari.st
Date: 1999-01-13 00:00:00 UTC
From: tjendol@wxs.nl
Message-ID: <77j9uk$6tg$1@reader1.wxs.nl>
Source record: 86297

Hi!

Is there any way to install Mintnet on a existing MiNT/NAES system,
without having to install KEMD first? I can't get KEMD to execute
properly on my Milan (not even when using new Mint.prg). I've also
tried to install it on my fathers ST and then copy it to my Milans
harddrive (minix partition). I made a big mess of it.
Is it possible to install the Mintnet stuff without a very complex
(I mean usr/etc etc folders with lots of files like with KEMD) Mint
setup?.
Hope someone has any advise,

Karsten

l> Newswatch or Popwatch loose a few characters too in the boxes, while
l> Menuinfo displays just fine. Don't have a clue how to get around
l> this.
l> Anyone with a solution for these problems?

There is a special version of Thing for N.AES, called N.Thing. (I did the
English translation of the Thing program and docs and there is mention of
this in the thing.stg file from which the thing.hyp hypertext help is
constructed; it uses an @if/@else construction so that this is not included
in the thing.hyp, only the nthing.hyp, IYSWIM). Like Thing itself, the
current released version is 1.27 (English & German). I'm not sure if this is
shareware or commercial. Try contacting the author, Thomas Binder, on
gryf@hrzpub.tu-darmstadt.de

On another subject, you mention VFAT and NEWFATFS. First of all what is the
difference between these two - what does which do? Secondly, in your mesage
on Jan 3 you mention inserting a config string of the type NEWFATFS=CDEFG....
I thought that you couldn't include C: if this is to be booted from - or am
I wrong there?

t> suppose, but I'm not entirely certain that HD drives can read some
t> of the weird formats that the ST can produce. My PC's drive
t> definitely can't.

That is down to the disk controller on the PC, not the drive. AFAIK all high density drives will read DD disks, even with weird formats, on the Atari; certainly the two I put in as my A and B drives do, one of which is wired to read high density as well.

Copying the contents to hard disk and then back to a new floppy as suggested by later posters to this topic may work in some cases but not for many protected games disks, which use weird formats, often without a directory sector, so that most copiers won't read them. A-copy will read and copy some of these, not others. Your best bet would be something like the Blitz Turbo copier lead and software, which makes an exact image of the floppy to another floppy. Whether this will keep indefinitely, unused, is a moot point. It probably will, but sometimes cosmic rays are supposed to be able to corrupt a byte or two...

And there are even said to be some games disks that have damage to the recording surface at a particular point (burned in with a laser) and check for this when loading -- if it's not there the game won't load.

g> in this folder and can be simply copied back.

That's all very well, but he was talking about floppies I think, and with these TRASH doesn't make much sense, since it doesn't make the space the deleted files occupied available for re-use! And that's surely the main point of deleting files....

But there is both undelete.ttp and undelete.prg (both PD) which will recover files if the disk hasn't been written to since the deletion. ISTR that one of these doesn't work 100% if the disk was very fragmented, since if the FAT has been cleared it can't find out where the next cluster is if it does not follow the previous one. This can be overcome for text files by using recovery programs that display the last sector and then ask 'Is this the next sector?' like the old (commercial) Michtron Utilities, and KnifeST does. The latter is the most flexible I have found for recovering deleted files from floppies, though some parts of the program don't work properly with large hard disk partitions.

Although "generic" floppies exist, it is not that hard to find 3M or Sony
brand, which for me at least, have worked quite well.

>

AES 4.10 that came with MultiTOS 1.08 beta contains some debugging
conde that makes it slow. The AES in TOS 4.92 apparently doesn't
have it, so programs launched from the desktop load much faster.

But at the other hand, the AES in TOS 4.92 is _definitely_ an
older version of the AES from MultiTOS 1.08. Just compare the
dates.

Gtx.

> AN old Cherry keyboard.
> 2 floppy drives, again can't see what size

The harddrives and optical disk, I can't help with. Maybe you could do a search for the manufacturers to see if they have websites etc for you to obtain more details.

The buffer sounds like a printer buffer which sits between your printer and computer, to cut down on time that your computer is locked up. This would be useful on the Falcon, as it doesn't need any software to work. However, modern applications often print in graphics mode to produce higher quality prints, and these buffers have fallen out of favour due to their low memory size, because graphics mode prints are large. It'll still help, but you may not notice much difference.

The keyboard definately can be used - I have one! :) My Falcon is recased in a Desktopper system, which also features a PC keyboard adapter which enables me to plug the keyboard in. However you don't need the Desktopper, as I've heard that these adapters can be fitted to normal Falcons.

Cheers!

Yep, it can count past the year 2000. It needs to seeing as astronomers may want to see how the sky will look 'x' number of years into the future or the past. Okay now when I test it, you can go up to 9999 AD.

Besides, the Atari should have no date problems until just into the 22 century, 2107 to be exact. Take the start date of 1980 and add 127 to it. That gives you the final year you can count up to.

Atari Planetarium handles dates independantly of the OS so there's no trouble until very far into the future. Who knows what we'll all be computing with by then. Maybe Atari clones? ;-)

Later...

I downloaded A-Mail yesterday to try on STing with the STing socket (I *STILL* can't get Mint setup, and have more or less given up any hope of that) however, when I tried to run it, it only said, "Where's my RSC file?" in a dialog box, then quit. The RSC file was right there next to it in the same directory. The doc's said nothing about putting files anywhere specific (although there were absolutely no doc's about setting it up with STing, only Mintnet). So what am I missing here? From what's been said here and from what I saw in the example images on the web page, it looked very nice. MyMail was way too slow and buggy on my Falcon, so I didn't use it for very long. I'd love to have a nice, aesthetically pleasing mail program like this. Also, does it print? That's the biggest feature I'm looking for at this point in an e-mail program. Newsie's nice, but isn't quite what I'm looking for yet. Any suggestions for helping me get A-Mail working? Thanks!

>Check if your MAGIX.INF file contains a line with the _TSL keyword. This
>line has to be deleted. (Also refer to the MagiC or HDDRIVER README for
>an explanation.)

Dear Dr Seimat,

Thanks for responding, but it doesn't help. Removing the _TSL keyword
makes no difference. I have included the MAGX.INF file as set up by
the installation program, but less the _TSL line below.

This is a TT with TOS 3.06 (English version). It has 4 mb of TT ram
and 64 mb of TT ram in an aixTT card. The internal drive is a QTM6330
Fireball 3.2 gb, SCSI id 0 and set to start at drive D in HD Driver.
Drive C is a Syquest ezFlyer 230mb cartridge with nothing on it but HD
Driver v 7.00 and Magic v6.01 as installed by the installation
program. The Syquest is set to SCSI id 5. There is also a SupraDrive
FD-10 at ASCI id 4 on the DMA port, which becomes drive L and a Sony
CDU415 (SCSI 2, drive P). I use ExtenDOS Gold.

There is a Matrix tc1208, but I haven't installed the Matrix software
or NVDI on this cartridge (or ExtenDOS)

My usual setup has HD Driver on a cartridge set to become drive K,
with Matrix/NVDI/Magic on the first partition of the Quantum, set to
drive C. My first, optimistic installation of Magic 6 in place of
Magic 5 on that partition with everything else in situ, produced
exactly the same result i.e.

"Off-screen driver not found" etc.

I have ordered your latest HD Driver version as an upgrade, but I am
not optimistic that it will fix anything.

Any further ideas that you have would be much appreciated.

David

Source record: 86208

While sending off my previous post on this puzzle an idea struck me.
The syquest cartridge is 230 mb. The partition that I use on the
Quantum for Magic 5 is 245mb. Are these too big?

The only small partition that I had immediately available is the
Supradrive FD-10, which is actually a 10mb 5.25" floppy. I installed
HD Driver and Magic 6 on a Supra disk, ejected the Syquest cartridge,
rebooted and - up came Magic 6 in all its glory.

So I have a couple of new questions.

What is the biggest partition that Magic 6 will boot off?
Why won't Magic 6 boot from a 250 mb partition when Magic 5 will?

aarrgghh!!

The new version of Tosbox will read the original ST disks.
It's an excellent Atari emulator for running gem
applications. You can get tosbox here:

http://www.emuclassics.com/tosbox/

Also, gemulator classic 3.8 from Emulators Unlimited will
read the old ST formatted disks. You can get it at:

http://www.emulators.com

Tosbox is the best emulator for gem applications, IMHO. It
hums along at a very fast clip in 800x600x16 colour mode and
runs Calamus SL in colour.

I've just downloaded aMail and its corresponding STiNG socket as well. As far as accessing my mailbox so far it's been brilliant, however as far as actually sending OUT mail it's being a real pig about it - it is saving the mail, but it's not putting it in the out box, or sending it for that matter, Is this something I'm missing in setting it up?

I'm using a 14 meg Falcon, MagiC5, NVDI 5, and STiNG.....

Oh yes, I'm also getting the message "not enough disk space" from time to time (although I have plenty of space on my hard disk).....

Hi Mike,

I think you *need* Mint plus N.AES to get it going. Then you have the
choice of going on MintNet or on Sting. The socket for Sting doesn't mean
you can run without Mint. You also need OLGA and an editor supporting it.

I've been trying to run it with the Stingsocket on MagiC, and it runs,
doesn't complain about RSC files but gives me several alertboxes "not
enough diskspace". I changed the \tmp file path to C:\tmp and it did a
better job, but on checking mail it said OK 3 mails for you, but on
getting them in it issued a warning. So I just left it at that. The docs
explicitly state you need Mint plus N.AES!

One disadvantage is it can't retrieve mail selective (yet?). All other
options look real nice.

The difference setting it up on MintNet or Sting (on Mint) is only
replacing the socket. Nothing else. And yes, it prints too :-)
Lotsa nice features: sending to a group, where you only write the msg once.
Takes the system font you have set in your AES by default, not the Atari
one like most apps (unless you set the Atari one in your AES). Capable of
handling Czech language... And a shell script to convert Newsie mailboxes
to unix-like ones.

HTH,

Hi again,

I've been told so by Thomas. Springfolders etc. I gathered the new version
has to be re-registered again. I think Thomas said it would take another
couple of months before it's out again... Plus personally I hope for more
color support (256 at least).

Well, I finally sent in my update fee for the 1.20+ versions.

From: Richard Smith <rsmith@planeteer.com>
Message-ID: <77mgb9$494$1@nntp2.uunet.ca>
Source record: 86217

Hello there,

I just picked up a Megafile 30 and a STand including 2 external floppy
drives for the grand total of $5 from the local Goodwill. Can anybody tell
me where I can pick up a cable to connect it to my ST ?

Please email responses to rsmith@planeteer.com

Thanks,

Richard.

> backdoor trick) ?. Anyone?

The Falcon keeps language settings in NVRAM. There are several programs (one came with your Falcon) that will let you alter the language (among other things). I personally use NVRAM.CPX. If you cannot find a program to do it, email me at e.kaljumagi1@genie.com and I'll send you one.

Just as a warning -- don't fiddle blindly with NVRAM settings. You can do some harmless but terribly annoying things to your computer.

Well, you're not getting my copy of Sundog! Perhaps B&C? (nope -- just checked). Don't worry too much about manuals -- they don't say anything useful except that somewhere is the place you are supposed to deliver things to (the premise of the game is that you inherited your relative's spacecraft AND his obligations -- he had a big contract with a group of cryogenated settlers).

However, the Yolo Atari Club does have some SC1224s. $20 plus shipping (which is often close to $20 -- big breakable things are they, these monitors).

about 'Magic 6' you wrote:

>Just installed Magic 6 on my F030 (NVDI 5). I am booting with USA
>Language and keyboard but end up with an English keyboard in Magic.
>How do I change this back to USA.
I think you'll have to use some keyboard utility like CKBD. It has
some predefined keyboard-tables and is actually a very usefull thing.
It also offers several ways to get to the unusual characters.
Good luck, Joost.

>crashes when the auto-save starts but turning that off doesn't make
>much of a difference. I also have an old NVDI 2.5 but does that run
>on a Falcon?

Do you have any other programs running in the background?
I almost always use the AUTO-folder program SUPER_78 (except when running CAF), which gives a more stable picture, but the screen often jumps to the right and wraps around on the monitor if it's active when using CAF. Without SUPER_78, the problem disappears. Maybe other programs can affect CAF in some other ways... Check out which programs are loaded at startup - both AUTO-folder programs and ACCessories - and try to disable them one by one to find out where the problem lies.
NVDI 2.5 works fine with CAF - the only drawback is that it doesn't have GDOS built in (but CAF doesn't make use of GDOS anyway, so what's the difference?).

: Highlights:

: 1) ST RAM upgrades by Bernie Diotte and Jim DeClerq

No, I did not write an article about an ST Ram upgrade. The author's name was at the end of that article. And, I have not finished my attempt at that ram upgrade. It is installed, but the additional memory is not recognized, and that seems to be due to the fact that Atari could accept MCU chips that failed testing of a pin they did not use.

That will add some cost to the project, but based on old postings in this group about an ST computer memory upgrade, which did not work until the MCU was replaced, due to the same problem, it may be common. This is a surface mount component with 144 pins. Changing it is not hard if you know how, but nearly impossible if you do not.

If you own solder, solder wick, liquid flux, a Weller Pyro Pen or equivalent and a 1/8 inch or metric equivalent chisel tip soldering iron, the technique is not hard to learn. You still need a very tiny tip on a soldering iron to connect a wire to pin 34 out of 144.

I've seen a similar problem myself on my TT with CAB and I tracked it
down to a progressive JPG image file. Drive "C" went nuts for a long
time and I almost thought I'd have to hit reset to stop it, but it
eventually stopped. Sure enough I could load just the JPG image into
cab locally and CAB would go nuts again with drive "C". I have a Nova
in my TT and I don't know if this is related but it is what I found
out.

Stvarno mislim da nije bas najbolja ideja koristiti neki drugi jezik
osim engleskog u medjunarodnoj njus-grupi. Gore navedeni posting
citam (odnosno preskacem) po ko zna koji put. Da li autor(i) uopste
cita(ju) rekacije na svoje poruke?

A evo, ima i egzoticnijih stvari od holandskog, naravno. Malo bi ozivelo
diskusiju da se javi neko na finskom, madjarskom, itd.

Btw. sta zapravo pise u citiranoj poruci?

Or, for the whole world to read:

I really think it is not a very good idea to use any other language
but english in an international news-group. I am reading (in fact, skipping)
the above-quoted posting for n-th time now. Does the author(s) read
the responses to his/their message(s) at all?

Yet, there are more exotic things than dutch, of course. It would liven-up
the discussion a little if people started posting in finnish, hungarian, etc.

Btw. what does the quoted message say?

Cu.

Go for it: it's a great monitor. But if for some reason, you really want
an SM124, I have a couple I would sell. Same price, but in Canadian
dollars (about $.62 US). If so, I'll buy Sheldon's 147.

Download Clocky from Petr Stehlik's homepage
(www.cyberstrider.org/mirrors/stehlik/), it's an excellent little TSR which
give you two editable keyboard-layouts in addition to the default. It also
provides hotkeys for some applications, a corner-clock (with graphics-card
support), a screensaver with powersaving (also for Nova) and some other
stuff.

The usual problem is that continual plugging/unplugging fractures the
solder connections of the port socket to the motherboard. You need to
strip the machine so you can get to the underside of the motherboard
and then re-solder it.

If this happens when accessing the SCSI drive it's a well-known bug of
the Falcon hardware which can often be cured by hardware fixes known as
clockpatches.

> I thought that you couldn't include C: if this is to be booted from - or am
>I wrong there?
>
Here's some info I got from an example config file:

NEWFATFS enables the MiNT FAT filesystem on selected drives (old TOS
filesystem is used otherwise). WARNING: this keyword may be gone soon
with all the old filesystem altogether!

VFAT enables VFAT extension on selected drives. VFAT may be activated
only on drives, those use the MiNT FAT filesystem.

VFATLCASE=[yn]
force return of FAT names in lower case on VFAT drives
global option; default is yes

You could be right on the C drive, I'm not sure though. I've set NEWFATFS
and VFAT to my H I J and K drives, since they are also MagiC vfat ones and
do contain long filename files (like the whatever.app1-13.new.tar.gz
types).

Djordje,

I can only agree 500 percent. I don't think the authors read in here, they
just crossposted to every area they could figure that may have been
interesting for them.

What it said? N-O-T-H-I-N-G at all! They told you if you were looking for
a music arranger job somewhere they would try to look for a job for you
for free. First they state "if.... you're looking for a nice job working
with Cubase in a studio and know all about midi etc, you are the person
being sought". Next they say "the job you're looking for, is what we are
going to look for for you". So there's nothing concrete in the msg.

I think it was more some kind of free advertisement for the guys :-)

My advise: skip and DELETE!

> On another subject, you mention VFAT and NEWFATFS. First of all what is the
> difference between these two - what does which do?

DOS filesystems (such as used on TOS machines) store directory content,
filesizes, etc. into a map called FAT (File Allocation Table), but it is
limited to 8+3 filenames, as you probably know.

Microsoft figured out a way to store longer filenames on a FAT filesystem,
by writing those extra infos to small hidden files that a VFAT driver can
read. I cannot remember what the V stands for, but it's just an extension
of the basic DOS filesystem; nothing more.

> Secondly, you mention inserting a config string of the type NEWFATFS=CDEFG....
> I thought that you couldn't include C: if this is to be booted from - or am
> I wrong there?

NEWFATFS is the name of MiNT 1.15's built-in DOS driver, which supercedes
TOS' own routines. Optionally, VFAT extension can be enabled on selected
drives (except on boot partitons, so it remains safe).

I was using K-Spead 3, I still have the program disk but it'd not readable
on a PC so I haven't been able to try an ST emulator. It did have the
ability to save Lotus 1-2-3 files (pity I didn't do that before getting rid
of the ST). Thanks for the conversion offer, only trouble is the
spreadsheets contain financial stuff and are kind of confidential ......
Will have to find someone with an ST to lend.
Cheers

OK, I'll try a translation:

Wanted a music arranger (or is that called a producer in English?-K.)
who can work with an Atari 1040ST.
For a studio in Almere/Zeewolde is Van Zijl Consultancy looking for a
arranger. Are you the person who can mix vocal and music, using
various equipment and a PC (Atari 1040ST). Can you work with (cubase)
VST/ PC. And do you know how to operate a studio and do you know much
about midi equipment? Then you are the person we want. It's
about a nice job on a freelance basis. We mediate for free. We are
going to find the job you want. Our role is only consultative. For
temporary jobs you can also contact us, visit our website about
howto: http://www.vzc.nl

> setup?.

Yes, it is possible, but why do it? If you only want MiNTnet itself and not
it's clients (most of them need atleast a unix-like disk-structure) I think
STiNG is a better choice.

If you really want MiNTnet (or need NFS or something like that) there is a
minimal installation on the MiNT '98 CD which IIRC doesn't need a
MinixFS-partition and only installs the bare essentials to get your computer
on the net (inc. NFS).

Source record: 86336
Cross-posted to: comp.sys.atari.st,comp.sys.palmtops,comp.sys.handhelds

Okay, I finally got an Atari Portfolio this week (yah, just ten years late...)

I'm trying to transfer some files from my desktop PC to the portfolio using the
Parallel Interface. The interface on the Portfolio is good (no "Communications
Error" messages), the interface on the PC is good (use it for my Zip drive all
the time), but when I hook them together and try to use FT to transfer files
between the two... nuthin'. Doesn't matter whether I set the PC or the Portfolio
as the server.

Any suggestions?

Source record: 86338

Hello,

I was using THEMADAT on an AtariST, but then I had to change to an AtariTT.

On the TT my original Themdat crashes very often with the bombs.

Do you have an idea what I could do, or where I could find a newer version of that program that works better with the TT.

I would buy an used program as well.

Themadat was sold from the german company SHIFT in Flensburg, who made as well the graphics program Arabesque.

Thomas

Two places to look are 1) the scsi cable - make sure it is a good,
expensive one, and 2) turn off the disk caches and try it that way.
I'm not sure whether this is a factor, but it might be. When I was
having similar difficulties, the size of the files that could be
copied seemed to have a relation to the size of the cache. (Which
cache? don't remember.)

There is a special N.AES Thing verson indeed. In fact it's included in the
N.AES package. With other words, if you buy N.AES you'll get an
registrated Thing. Keep in mind though that N.Thing only runs with N.AES.

I don't use this version because I've some probs with it, especially when
I run in 65k or 24b colormode.

I've launched it with Magic. After setting the paths up, I didn't have
the "space on disk" problem. I deleted some slashes in the paths that
could confuse my normal FAT system. The "only" problem is that my
editor, EvereST is not launched :-(

Bye,

>This is certainly not the case with Nova VDI.
>

Weird or not, it runs, shows icons in 256 cols and when asking the INFObox
it says: screen: 832x624, 32 bits per pixel. So Thing knows it's running
TC.
When I occasionally run 8 bit mode it says so too!

Dunno exactly which version I ran at the time I fetched those Jinnee
icons, could have been 1.20... I'm using the NVDI 4.12 for Matrix here.
Perhaps that one fools Thing?

>are buggy.
>
Jo Even, and Daniel:

I just copied from the textfile, and this one says AES 4.00 at least is
needed, apart from Mint.

Actually, it runs on my MagiC 5 as well. When I tried to fetch 3 emails
yesterday it issued a warning that the msgs could be damaged or something
like that. Checking the mail was no problem. Didn't try to send mail.

But the whole screen looks about the same when running under MagiC.

I could easily make the same screenshots here.

Perhaps the bugginess under MagiC needs more work?

Apart from that, I won't use it on a regular basis as long as it won't
retrieve mail selective. That's one standard I demand here. For testing
it's OK enough.

Yes. The board provides both the 3.3V regulation and some logic circuit to
adapt timing.

>> Ths Milan TOS runs with full 040 caches (both on, copyback mode), but you
>> can turn them off if you need to.
>
>Do you know if the compiled utilites check to see what machine is in use, or
>just use the new call for 060 identification?

Which compiled utilities, and which new call are you talking about?

The TOS sets the _CPU and _FPU cookies to indicate the CPU, and the
CacheCtrl() OS call can be used to handel cache issues (note, however, that
a clean application program should not need to know about the cache at all).

The supplied utilities do not care about the CPU at all, since they do not
need to.

As long as they don't use some strange asymmetric mapping - the Milan needs
at least 16MB *in one block* in bank 0, and asymmetric (rows != columns)
SIMMs can't provide that. However, they will work in addition to a symmetric
16MB SIMM.

Hi All,

My all-time favourite game is still Asteroids - I even bought the arcade machine and played it to destruction !!
My son has just shown me a clip from Cybernet which had a review of the new PlayStation 3-D version of this very game. It looks impressive and the two-player mode could be fun.

Any of you programmers fancy updating my old favourite to a similar level ?

Jim.

According to Pacifist docs, a command of the form

/ini <filename>

can be used to enable pacifist to use a different configuration file
from the normal pacifist.ini.

Where is this directive put?

The command line in 'properties' box already contains the pacifist.exe
path.

Thanks Lewis

I've tried to install CKBD on my Milan today. Somehow it doesn't work. The only thing that is working is its mouse speeder. It says it works with Multitos, so I figure it should work under Naes here to. I've tried different places for the auto-folder program (before Mint; after Mint; between Mint and NVDI...), but it doesn't make any difference. Maybe it is because i use Cops for the cpx. Cops doesn't load it's preferences correctly under Naes here.
Does anyone know a sollution? I hope not it is because it doesn't like a Milan...

I think therefore I AM.

1044. floppy disk read problem

Newsgroup: comp.sys.atari.st
Date: 1999-01-15 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <77o4svnma1@news2.xs4all.nl>
Source record: 86157

After installing the latest FreeMint with the VFAT support (it is
1.15 68030 version as I remember) a strange problem was experienced
with floppy disks formatted from the desktop TOS 1.2.
Readable on Single TOS TT, not with multitasking mint+N.aes+thing.
TT becomes a 'buzy-bee-till-eternity'.

I found out the problem disappears when BigDos is not loaded.

Any suggestion about why?

>
>Is there any way to install Mintnet on a existing MiNT/NAES system,
>without having to install KEMD first?

In Germany they have the Mint98 disk.

There are 3 types of installation:
1. very basic, only client in a network (no harddisk required)
2. a bigger one with Minix partition, adminstration etc.
3. a full version with everything to become a real server.

What you get:
1. remote printers
2. remote harddisks
3. all normal Intranet functions (mail, ftp, e-mail)
4. strange computers in the network (Wind, Unix, Linux,..) are no
problem.
5. Your Atari computer can run n.aes and thing and so not become
instantly a strange machine

A first tentative report about it can be read in the Dutch 'ST
magazine'.

>
>>Don't get any DD or HD floppies that are branded SELECT, they are a load of
>>crap, you won't believe how many of these I have had to throw away

For years now I take care of the Public Domain Disks department of
the Stichting ST.
In the haydays many thousands of disks each year were sold.
Getting bad disks back is a terrible hassle, so we tried to minimize
bad disks.
First: we copy with FCopy and set the parameters on '0 errors'. That
means: when formatting during copy only 1 try is done. If that goes
wrong: disk is bad.
Further: using 'verify' takes too long for each disk so that is OFF.
And you have a risk of flipped bits.

Now for the results:
---

all no-name or no-label disks were BAD.
During copy we had sometimes a fall-out of 1 in 8.
Well know brands were mostly better but came not above 1 in 70.
The best result we had with TDK disks (not cheap) with a initial fall-
out of 1 in 100.

So we kept TDK until they stopped production.

The endresult was: we got about 1 in 300 returned with read-error
because of faulty disk.

P.S.

As secretary I recieve many floppy disks. And I can tell you that
nowadays people use no-name disks that are just as un-usable as years
ago. I think 1 in 4 I recieve has a read error. But I have not a big
number to do reliable statistics on compared to the story above.

Source record: 86161

Hi,

just checked some further, aMail running from Magic 5.01:

set up a config for this one, using the Stingsocket, and as said before, the tmp dir now sits on C:\, because the Minix drive is unaccessible from MagiC.

Writing a msg with Mime attach looks OK, but won't be sent. Displaying the outbox states nothing, opening up the dir says file "outbox 0" with somany bytes is there.

Checking mail displays correct number of msgs.

Getting mail results in a warning that files maybe damaged and result in deletion on the server, when clicking "proceed" nothing gets in.

Even setting up all the paths again for the MagiC config results in the alert "no diskspace available", which btw only shows up every now and then.

Running on Mint/Mintnet is perfect. I've tried UUE attachs, MIME stuff and it all works 100%. My only wish is it would support selective mail retrieval. Adding decent MagiC support would be a bonus, tho' :-)

>
>
Daniel,

getting the same stuff over here on MagiC 5, it does write the mail (I can
check the tmp path) but won't put it in OUTBOX, thus nothing is sent.

I can get a summary (amount) of mail waiting on the server, but it won't
be transmitted. How's that with you?

I guess the MagiC support needs upgrading :-) Running Mint/MintNet is 100%!

AFAIK MiNT '98 is based on the KGMD.
If Karsten want to install MiNTnet he will have to install KGMD (or if you
like MiNT '98) or TAF.

RC>and then re-solder it.

Well you don't have to strip the whole machine. Just get it's top off. :-)

I just did a fix on my mouse port. Taking the keyboard out and apart was
pretty straight forward. Unfortunately I lost a rubber cup that goes under
each key. Now my Retrun key on the numeric keypad is non-functional until
I can find a source for those cups.

Asside from getting inside the keyboard assembly, all that needs doing is
some reheating of solder on the pins.

1065. Re: ASH emailer vieuws please

Newsgroup: comp.sys.atari.st
Date: 1999-01-15 00:00:00 UTC
From: atasoft@atari-computer.com
Message-ID: <77luv2$lp6$3@news3.Belgium.EU.net>
Source record: 86219

Derryck Crocker asked on 8 jan 1999:

>>>Anyone using ASH's emailer/newsreader here? I'm considering buying a copy to<<<

I'm using ASH Emailer a couple of months now, and I've got mixed feelings about the program

It only works with IConnect, so I can't use it as a client under STING
When using it in combination with CAB you're stuck with a weird ASH CAB.OVL....

The newsgroup-section of the program can use a update. It's not possible
to see the headers of the different postings, wich means You've got to
download every message. With the atari-newsgroups that's not really a problem,
but in some newsgroups they've got the habit of attaching big files at the postings
There is no way to say that you don't want these, so sometimes downloading
the newsgroups can take ages....

I do like the email section, it is straightforward and very intuitive=
The documentation however is a laugh=... The program can do a lot more then it
looks like at first glimpse,=
but you've got to find out all for yourself (Keyboard shortcuts etc)
aren't documented, neither is the fact that you can change fonts etc..

I gues for someone who uses CAB running under Iconnect, it's perfect, together with FIFI,
one can do email, ftp and newsgroups all in one=
For people who like the CAB/STING combination with the superior CAB.OVL, well NEWSIE isn't
that bad and neither is MYMAIL. And the nice thing about
these two is that they are free, witch can't be said for ASH Emailer.

In general (don't flame me) I like the ASH products, but this program is
really something witch shouldn't have been released, they should have
included it in CAB 2.7.....

Cheers from Belgium

Funny, I just follow the instructions on how to get a keyboard keys setting file which I downloaded from MagiC OS Support Page. It seems to work OK with on my US-keyboard Falcon. All I needed was to place the SYS file on my extension. There was a C source which you can compile with the keys you wanted changed, it created that SYS file.

>So I have a couple of new questions.
>
>What is the biggest partition that Magic 6 will boot off?
>Why won't Magic 6 boot from a 250 mb partition when Magic 5 will?

This is insane.

I tried to answer my own questions.

It appears that the variable is not the size of partition, but the external bus.

I tried partitioning a cartridge, but even with as small a partition as 14 mb, I can't get Magic 6 to boot off the Syquest when it's attached to the SCSI bus.

But if I connect the Syquest to the SCSI port on the back of the SupraDrive, so that it becomes ASCI id 5, and reconfigure HD Driver accordingly, up comes Magic 6

I have no evidence, apart from theis problem, of anything amiss with my SCSI bus. Under Magic 5, TOS or Mint the SCSI bus drives, and the CD-rom all seem to work without problems.

What is going on?

It supports 256-colour icons, but not in non-palette modes. IIRC Thomas
Binder said he would use the new dithering/palette-functions in NVDI5 to
support this.

I hope that this is the final installment from me in this crazy story.

I have now determined that the controlling variable is the location of
HD Driver.

If HD Driver is booted from the ASCI bus, then Magic 6 can be located
on any drive. If HD Driver is booted from the Syquest on the SCSI bus,
then Magic 6 will not boot.

Any possible explanation of this eludes me.

The only company that even expressed an interest in carring the Milan,
in the US, was Godfather Computers. Since their initial request for people to
contact them, there has been no other news. You might try ATY in Oakland
or some of the other Atari dealers, but no one has posted anything in
this Newsgroup (that I remember seeing) regarding Milan sales in North
America.

You can build one yourself using 2 DB19 connectors. The cable is a
simple pin-to-pin jobbie.

No, they aren't With MagiC the maximum partition size is 1 GByte.

> What is the biggest partition that Magic 6 will boot off?

The boot partition size depends on the TOS version. The boot partition
can be as large as the largest partition that is possible with your
version of TOS (not MagiC). I. e. there are no limits for the boot
partition size except the general limits for partition size. See the
HDDRUTIL online help for partitioning for a list of limits.

> Why won't Magic 6 boot from a 250 mb partition when Magic 5 will?

You should ask Andreas Kromke, the author of MagiC.

CO>How can I tell what version of TOS I have on either of my old 520STs?
Try a system diagnostic program like SYSINFO.PRG that ought to give you the answer. Typically the ST's you mention in your message are likely going to be TOS 1.00 or TOS 1.02. If it's the TOS 1.00 version seriously consider getting an upgrade since that version is very buggy. TOS 1.02 based on my experience using it, is quite acceptable.
CO>Can I upgrade either machine to 1MB or beyond without hacking the
CO>motherboard too badly?
Nope, there's a lot of soldering any way you look at it, but yes it can be taken to 1MB.

You can also try buying one second-hand or building one yourself
(see DOITF030 archive for more info). This last one can be fitted with a
single 16 Mb SIMM, which is (was) really cheap. If you don't mind soldering
about 90 points you can probably make a memory-upgrade for about
$20-$40 (that includes SIMM price).

AFAIK, Thing supports 256 color icons for some time now. When Jinnee came
out I took several of the 256 color icons from its RSC file and added them
to the Thing icn file, no problem (one of them the CAB icon in 256 cols).
What I would like is support for 256 colors in backgrounds, texts etc.

BTW, if I read you correct, you say it supports 256 cols but not in non-
palette modes... that would mean in TC, that's a non-palette one. Rite now
I've got no prob at all running in TC...

Daniel,

you're supposed to run it on Mint and N.AES....!!! Not from MagiC.
I get the same messages when trying to run from MagiC. It runs beautiful
from Mint/N.AES tho' (only tested MintNet thusfar).

This time it's for me, to say RTFM: one of the first lines tell you what
you *NEED* to get it going. Appearently the possibility to run on Sting is
mistaken by people that it will run with TOS+Sting or MagiC+Sting...

> > and let you know.
> >
> Please consider me interested.

OK, here goes, but please note that I have recalled some of this from memory
and so it may not be 100% accurate.

We'll assume that we have two ataris, a TT and a Falcon. The TT has a modem
on Modem1 and the TT and Falcon are connected together via their Modem2 ports.

For this example we will say that the TT's IP Address is 192.168.128.1 and
the Falcon's 192.168.128.2 (192.168.128.xxx addresses are reserved IP's for
use with internal networks and should therefore not cause IP problems when
on-line).

The TT's ROUTE.TAB should look like this:

192.168.128.2 255.255.255.255 Modem 2 0.0.0.0
0.0.0.0. 0.0.0.0 Modem 2 0.0.0.0

The first entry points to the Falcon and ensures that it is
always reachable. The second states the default gateway. The
second entry is altered by the dialer when connecting to
point to the Internet and therefore allowing all packets not
directed to 192.168.128.2 to get out onto the Internet and
beyond. In order for the dialer to do this you must switch
on the "Add default route" option in the Dialer config.

The Falcon's ROUTE.TAB should look like this:

0.0.0.0. 0.0.0.0 Modem 2 0.0.0.0

This just states the default Gateway and ensures all packets
are routed via Modem 2.

Using the ports CPX ensure that the network ports for
each machine (TT Modem 2 & Falcon Modem 2) are set-up
with the correct IP Address, both machines are
using the same protocols (SLIP/PPP etc) and the active
option has been selected. You will also need to select

the Reload routing table option to ensure that the
ROUTE.TAB file is read when you click on OK.

Hopefully now, you will have an Internal network running.

To use IP Masquerading, the TT will need MASQUE.STX and you
will need to enable the dialer option "IP Masquerading".

Now when the TT is connected to the Internet you should also
be able to access the Internet from the Falcon.

Happy Networking :-)

Regards,

Ben Hills.

*** Long post warning *** Mega St and 'accessories' on ebay?

I have TONS of Atari ST stuff that I just don't use, and I guess its time to see if I can find it a good home. I'm thinking about listing the following items on the ebay (www.ebay.com) auctions individually and/or in groups of items. As I haven't run any of this software/hardware in years it will have to be sold as-is. All software comes with boxes and doc's unless otherwise listed. I got a lot of this stuff when I bought the system, so I've never even run it myself.

Please Email >>>dcard1@stny.lrun.com<<< with any items you'd like to see listed first. As I add items to ebay, I'll post a message to this group to let possible bidders know. Final shipping will of course be the responsibility of the buyer.

Here we go....

Hardware

MEGA ST 2
Mono Monitor
Color Monitor
Monitor Master
85 Meg ICD hard drive (needs new power supply)
360k 5-1/4" external floppy drive
Okimate 20 Color Printer (three black and one color cartridge)
Avatex 1200 Baud Modem
2 Quickshot Joysticks

Software

Simulation

Falcon
Falcon Mission Disk 1
Their Finest Hour
Red Storm Rising
Gunship
Midwinter
Fighter Bomber
Carrier Command
Starflight
Tracker

Sports

Wayne Gretzky Hockey
MicroLeague Baseball

Sierra Adventure Games

Colonel's Bequest
King's Quest II, III, IV
Hero's Quest - So you want to be a Hero
Space Quest I , III
ManHunter / New York
Police Quest I

Other Adventures

Dungeon Master
Dungeon Master - Chaos Strikes back
Ultima IV - Quest of the Avatar
Zak McKraken and the Alien Mindbenders
Star Trek - The Rebel Universe
Space Ace
Drakkhen
Paladin
The Pawn
Bard's Tale (I think a disk was bad)
Infocom - Hollywood Hijinx

Arcade/General Games

Barbarian
Obliterator
Oids
Xenon 2
Sim City
Populous
Populous - the promised lands
Risk
speedBall
SpeedBall 2
BlockBuster
Vampire's Empire
Monster Grand Slam
Prince
North and South
Armada

System

NeoDesk 3.0
NeoDesk Developers Kit
NeoDesk CLI

PC Ditto
Minix
Revolver
Turbo ST v 1.6
A&D Universal Item Selector II v2.0
ICD utilities

Word Processors

Word Perfect
Neocept Wordup
Neocept Fontz
Thunder Spellchecker
Mavis Beacon Teaches typing (bad disk I think)

Graphic Editors

The docs in the current aMail-archive is not quite up-to-date. It *is*
supposed to work under MagiC, there's even screenshots of it running under
MagiC6 on Atack's homepage. But since both STiNG- and MagiC-compatibility
apparently has been added recently it's possible that one of these (or both)
are buggy.

This is weird, since not even the 1.28-beta supported 256-colour icons in non-palette modes (confirmed by Thomas Binder)... It could be that your VDI fools it, and that Thing believes only 256 colours are available even in TC. This is certainly not the case with Nova VDI.

N.AES 1.20 looks exactly like Magic 5.xx and borrows a _lot_ of
visual features, BUT, I _would_ think aMail can run on Magic.

>
Mike,

there is some confusion going around now:

I've always been thinking, aMail needs Mint at least. There would be a
Mintnet version. So finally, (last weekend) it sees the public light
(note, not the public RED lite...) and according to the docs there is a
socket provided with it to run on Sting.
So I read on and yes, it's in the second paragraph "what's needed?"
Still says Mint and AES 4.00. Nothing about MagiC or TOS or whatever.

So I tried it on Mint plus MintNet (got that installed, remember?)

Silly Lewey wouldn't be silly Lewey if he wouldn't try at least what it
does under MagiC.... so I give it a try... and it starts running (where I
simply expected an error message). It won't fetch/send mail.

Next Jo Even sez, MagiC compatibility has been added in a late state, and
the docs are no longer up-to-date. At the same time I read you and Daniel
trying to run it from MagiC too... with appearently the same problems.

Now, I gather you can simply stick a Mintnp.prg into your autofolder, run
Sting behind, install an AES (Gem.sys would do) and give it a try again.
(Erm, plus Gluestik and Gsresolv.prg ? I already forgot whether or not
these are needed to run with Sting, but anyways) You don't need the
complete Minix stuff for it.

I haven't tried it this way yet, only on Mintnet, and it goes perfectly.

HTH,

Source record: 86098

I currently use CAB 2.5 which doesn't support cascading style sheets,
though it does recognise the STYLE tag and ignore embedded style sheet
information on pages.

Does CAB 2.7 support CSS? If not, does anyone know if it's planned for
future versions?

TIA
John

> He, I just switch to Monaco ISO 8859-1 font and yes indeed it's more or
> the less the Fuji-symbol.

By rights the Fuji characters (and others) shouldn't have been included in the ISO 8859-1 Monaco font. I decided to include them because of their use in some signatures here, conforming to the original Atari character set (but not to ISO 8859-1 or any other standard). I think the information symbol ('i') originated from NVDI's version of Monaco, a somewhat symbolic replacement for the two-character Fuji symbol.

But it doesn't matter what characters are actually 'there' because they shouldn't be used anyway. MacSOUP, for instance, displays an outlined box in place of 'non-standard' characters -- the Fuji symbol ends up looking like a very small crossword puzzle.

Ideally, ISO 8859-1 Monaco should have a pronounced character, used repeatedly throughout the non-standard slots, to warn users that they are about to break convention during composition. There would be no problems so long as it's installed as an adjunct to the system font (like in NEWSie or FireNEWS).

Atari Falcon For Sale:

Atari Falcon with 84 meg internal HD,14 megs of RAM,
math co-processor installed, and RGB,VGA monitor adapters,
with manual and box. HD is loaded with all ORIGINAL
Falcon software, inc. Atariworks, plus much more.
Price in USA $650.00 plus shipping/COD.

I also have the external TOAD Syquest 88/44 hard drive,
which was a perfect complement for backing up internal
HD. The Syquest will write to 88 meg carts, and read 44
also.It comes with cable, and 7 - 88 meg carts.
There's a 14.4 ext. modem if needed.
The price of the Falcon and external HD stuff is
$775.00 plus shipping in USA/COD.

If there is anyone in the NYC area, that would be interested
in picking up the Atari Falcon, instead of mailing it, I will include
an Atari SC1224 monitor in excellent working order, for
free.

If interested, please leave Email for Barry Summer at:
bsummer@delphi.com

Happy holidays, everyone!!
Barry

Atari software for sale:

Here is a huge grab bag of ORIGINAL Atari software.
I believe only 2 or 3 are Falcon Specific. All have docs unless
specified otherwise.
Over 15 programs/games for $50.00, incl. shipping in U.S.A.

Diamond Edge
Diamond Back 3
ICD-Pro Utilities
Image Copy 2
Stalker 3
Word Writer ST
Compo C-Font
Cyber texture
Certificate Maker
DEluxe Paint
View II
Awesome Arcade Pack(Xenon,Blastaball,Sidewinder)
ANM LINK-Falcon
Pinball Dreams-Falcon

These 2 have no docs: Degas Elite and Gauntlet 2.

I really don't want to mail things separately, so I've made the price
really low.
If interested leave e-mail for Barry Summer at:
bsummer@delphi.com

THank you!!
I also will include Mouse Master from Practical Solutions.

> Still says Mint and AES 4.00. Nothing about MagiC or TOS or whatever.

...but since there are screenshots of aMail running under MagiC6 on
Atack's web-site it's quite obvious that it's intended to work under
MagiC...

> Now, I gather you can simply stick a Mintnp.prg into your autofolder, run
> Sting behind, install an AES (Gem.sys would do) and give it a try again.

Correct, a simple MultiTOS-installation will work. Installing MiNT is
actually very easy, it's simply a matter of...

a) put MiNT.prg in the autofolder. It should be the last program to
execute, unless you have STiNG which must run after MiNT.

b) Put GEM.SYS and GEM.CNF in c:\multitos, and edit c:\multitos
accordingly. If anybody's interested just ask me and I'll provide you
with a complete, working setup.

> (Erm, plus Gluestik and Gsresolv.prg ? I already forgot whether or not
> these are needed to run with Sting, but anyways) You don't need the

No, GlueSTiK etc. is a *STiK-emulator* for MiNTnet, it has absolutely
nothing to do with STiNG.

> like MiNT '98) or TAF.

This is not necessary, it's quite possible to set up MiNTnet and pppd
independently of these distributions. Basically what you need is...

a) The basic MiNTnet-stuff (sockdev.xdd, slip.xif) in c:\mint or
c:\multitos
b) Some directories linked to u:\ (u:\etc, u:\etc\ppp, u:\var\log,
u:\bin)
c) syslogd must be configured and running.
d) pppd -------------"-----------------
e) A couple of configuration-files for MiNTnet in u:\etc.
f) Some spare time to read the documentation...

AFAIK the ppp-kit was based on something like this, but it was
unecessary complex and really didn't work well.

AMOS is way better than STOS, mostly because it's a more modern and structured language. You don't use line-numbers, there are while/repeat-loops, procedures, functions etc. I haven't used it since 1990 (when I had an Amiga for about one week) so I don't remember all the details, but it was very frustrating to go back to STOS after that.

I never had any success with CKBD under MiNT, but I know that
Martin-Eric Racine (Q-Funk) use(d) it under MiNT/N.AES so I guess it's
possible.

All of these work fine on the Falcon (with the exception of early
versions of the Lattice-editor which didn't work on Falcons), but
remember that HiSoft C is a interpreter and not a compiler.

>>Are they reasonably upto date feature wise.

If you update the libraries both Lattice and Sozobon are as upto date
as you can get it.

>>Does a C++ compiler exist?

> GCC is the only one, to the best of my knowledge. Of course, Gnu C isn't all
> that well-adapted to TOS.

Why do you say that? GCC is definitely the best C-compiler (and the
only C++) for TOS right now, with the latest GEM- and MiNT-libs you
have support for everything available today. This includes the latest
NVDI-, MagiC- and N.AES-features.

Hello,

I got several ATARI STs at home that I used for many years,
but now I do not want to own them anymore. Who is interested
in the following machines?

Please send me an information on what you would liek to have
and what you think you would like to pay for it...

My address:

arnebaier@aol.com

That's what I've got here:

MEGA 4ST (ddd), 52MB HDD, PCspeed PC-emulator, scanner SPAT,
digitizer, tons of software (expensive-bought ones, public
domain, shareware etc., please ask me for a list).

1040 STFM with printer STAR-NL 10
1040 STE

printer EPSON FX-80 9pin
supra modem 2400Bd

AND LOTS LOTS MORE

PLEASE ASK ME FOR ANYTHING YOU WANT

THIS OLD STUFF WON'T BE TOO EXPENSIVE FOR YOU, I think!!!

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,
I have been an Atari ST user since they first came out.
I use my 1040 STE 4meg for MIDI exclusively.
My monitor is starting to black out from time to time, so I am thinking of
starting to use my Pentium for midi as well.

Is there a better way to port to the Pentium other than saving creator files
as midi standard to a floppy and importing it to cakewalk?

Is there any utility that might help me with this?

Thx in advance

Well, maybe any Emailer user can supply you with the information/data
you need.. Or else I can (my father used to have it).
But maybe we should find out first if there are any users out there
who would like it... As I recall, Emailer only works with Magic
installed, so it is not interesting for all the atari users out there.

Well, ControlZ crashes to often here on my system, ControlX is too
limited I think. And I like the look of Cops.
On my late Falcon, I used CKBD to compose characters; Dutch accents,
special Danish characters...

> and not the other way around.

Well Martin, I totally agree with you. But keep on saying that isn't
really helping. There are people who bought Emailer, but at a certain
can't use IConnect anymore. No, I'l explain what I mean. Since a few
weeks, my father has access to the internet too. As he is getting
old, and quite slow in understanding computers (sorry dad ;^)),
IConnect with Cab/Fiffi/Emailer was the best choice for him. It dials
and hangs up automatically, so he hasn't to think so much (just like
in Windoze) ;^)

But unfortunately his new modem didn't work well together with
IConnect, so he has to use STing. Now after two weeks thinking of
what's the next step to do while getting mail, it costs him at least
five minutes extra online.

But the biggest problem doesn't seem to be STing, but Newsie. As
working with Emailer was rather easy for him to understand (probably
because it is very graphical) Newsie was more difficult (too many
functions to choose from). The only STing mailer that has the ease of
Emailer is MyMail. But it crashes on his setup, when deleting mail on
server. So I think he would be very glad if he could use Emailer
under STing.

Isn't it zControl:-)). Anyway on my system (hades 060/N.AES/freeMiNT
1.15.1-0.5) zControl v 0.24+ runs just fine. I agree that xControl is
limited in his use but it's still solid like a rock.
I don't like the look of Cops -over kleur en smaak valt er niet te
discussiï¿½ren. There is one option left though, fileselector Freedom 2.05
which comes with his own controlpanel. I do like freedom but I don't use
the control panel option as it crashes all the time on my system. I've
heard from others that it work (he Louis) so you may give this a try.

There is a very nice utility with which you can assign other keys to your
keyboard (it does some other things too). It's called Clocky 2.37beta

You can find the latest version on the homepage of Petr Stehlik
http://cas3.zlin.vutbr.cz/~stehlik/

It is ofcourse on the Belgian ftp-site too

HDdriver v 7.6.
Standard TOS can only read DOS partition up to 32 MB so you'll need BIGDOS
or freeMiNT 1.15 to read DOS partitions >32 MB.
HDdriver v7.6 has an option to partitionate zips TOS/DOS compatible. Works
very good. I'm using this to transfer files from Atari to Mac and vice
versa. With freeMINT 1.15 you can even have long file names (VFAT, FAT32)

Repartitionate then with HDdriver v 7.x. This driver holds an option to
partitionate zip TOS/DOS compatible. Works very good.

Does anyone also know a source of 'keyclicks' I remember these being
advertised in ST Format some time ago , but I can't remember the
company. They enhanced the keyboard by creating clicky keys , like PC
Keyboards.

I've never noticed any unstability and I've used it for years on
everything from a ST->TT including a Falcon. Under TOS 1.0 - 4.04, Magic
and MiNT with AE

S 4.1. Only problem I've ever had is that you can get a conflict with it
and NVDI if you don't have NVDI configured properly.

John - the only company in the US that even expressed an interest in the Milan was Godfather computers. They were asking for people to contact them a few months ago so they could determine if there was enought interest (http://www.godfather.com). I, for one, would also be interested, but only in the 060 or a PPC version of the Milan (one can always dream).

Dunno about this.

>It is a shame to see one old Mega ST after another cannibalized to keep
>another TT alive, because of those stupid membrane switches.
>
>Opinions please.

OK :)
If your TT keys are working intermittently and need to be pressed
with extra force, that's because you have done just that and probably
crushed or worn down the contact pads. If so, stick a double layer of
insulating tape *under* the affected pads on the mylar. This will
bring them closer to the key-contacts and, hopefully, restore them.
Try not to press so hard on them.

If the Control key has stopped altogether, you need the instructions
from Mario Becroft to repair the circuit, which is broken at the top
left of the mylar. Mario posted this in detail last year, and he
prophesied that this *will* happen eventually. It will! :(

But it's an opportunity to clean out the collected gunge and fluff.

Cheers, Charles.

You may find my Atari year 2000 page helpful:

http://www.whalley.demon.co.uk/atari/y2k.html

There's nothing specific about the Mega at present. If you do find out
anything else, I'd be grateful if you could let me know so I can add it to
the page.

> Sorry if this has been discussed too much already here.

There hasn't been a great deal of discussion here as (as far as we can
tell) it's not *that* much of a problem on Ataris.

So even when using STing, it requires Mint? What's the point then? I
have never had any luck getting Mint to work, no matter how hard I've
tried and how much I'd love to use Mintnet and the additional apps
available for it, so basically this is absolutely useless to me.
If its supposed to be STing compatible, then why not make it run on
STing regardless of whether or not Mint is running so that its more
widely usable? BTW, I didn't remember seeing it stated anywhere that
it still requires Mint to run it on STing. Maybe that should be made
a little more clear. Just a thought.

Euch the Fuji symbol? I'm using 'ASCI-code 15' which give me a nice 'i' at
least that is what it does with the monaco monospace font.
He, I just switch to Monaco ISO 8859-1 font and yes indeed it's more or
the less the Fuji-symbol.

>Does anyone know a printer that reacts logically in this case?

My printer, HP laserjet 4 plus just ignore that symbol. No problem to
print.
To avoid problems I'll delete these symbols.

I had these Atari symbols in my signature long ago. But a friend told me
the same problem you discribe. It's because these codes are normaly not
printable, they are control codes (<32). So I removed them...

Bye,
/Pascal/

MiNT and MiNTnet are not the same. You can use MiNT without MiNTnet but
not the other way round. Setting up MiNT is really a piece of cake.
MiNtnet is another story.

Hi Guys,

I'm selling Atari ST STOS Creator, Compiler, Maestro and Games Galore and they have been listed on ebay at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=57218673

There is a full description and pictures of all included items.
Auction ends 1/22/99.

1150. Re: Where can I get a cheap C compiler to work on my Falcon

>
>Are there any decent sites supporting Atari C software?

As far as I know Lattice C v5.6 should run on a Falcon as it has the
additional libraries etc.. to write programs for it.

And I have a copy for sale:)

1151. FaST Technology board

Newsgroup: comp.sys.atari.st
Date: 1999-01-17 00:00:00 UTC
From: anarkist@idirect.com
Message-ID: <36a1772c.0@nemo.idirect.com>
Source record: 86045

I sent a previous message, but did not see it show up.
So I'll try again.
TAF has a Mega4, with a moniterm monitor video card, and a 1991 FaST
Technology 68030 board that no longer works, to produce its newsletter.
Does anyone know anything about the FaST board? if it can be repaired?
(It works if you bend the board down about a 1/4" halfway up the board,
over the DEGQ9031 chip, seems to be a broken trace somewhere.
Can anyone a\offer advice, a board to sell/trade?
thanks
ken

OK some repetition here and I am certain even more by the time everyone posts
and I finally send this. What a great simple IDEA. Here are mine and I am
not a big game player.

1)Dungeon Master (1986, FIRST REAL GAME EVER!!!) 13years still not finished
2)Falcon (Amazing that a 520ST can do this)
3)Formula One (Also amazing a 520ST does this)
4)Stunt Track Racer (Head to head on 520ST even)
5)RVF Racer (Bad graphics, but I am a bikehead)
6)Midi Maze (I have 6 STs, what can I say:-).
7)Any Balance of Power game (I only have first one)
8)Joust (OK its old but I can leave it alone)
9)Megaroids (Simple fun and free) Betters ones sure, but...1985?
10)Anything STOSSER, I have just discovered this stuff. Really fun, Nieces
and Nephews love it. TOTALLY ATARI. TOTAL STOSS. TOTALLY CURRENT:-).

I haven't really tried to any ST games on the falcon, and have no real Falcon
developed games. Are these available? Regardless, I only seem to look at a game
about once every 6 months and I haven't spent enough time on the Falcon with
what I do have.

Yes, but it's a long time ago,
so don't ask me why I did it the (rather complicated) way I did it...
(can't remember, but I guess I had my reasons)

The function works ok interpreted and compiled,
but there's a special feature (commented out here) that does *not*
work compiled, it crashes then. I don't think you need this one though...
(You can omit the last argument then)

```
FUNCTION does_this_directory_exist(file$,y$,code%,n%) ! y$=name. code%=attribut
$F%
LOCAL i%,a%,x$
a!=FALSE
VOID GEMDOS(26,L:BASEPAGE+128) ! setdta
file$=file$+CHR$(0)
a%=GEMDOS(78,L:VARPTR(file$),W:code%) ! fsfirst
WHILE a%=0 ! while files
x$=SPACE$(20)
BMOVE BASEPAGE+158,VARPTR(x$),14
x$=LEFT$(x$,INSTR(x$,CHR$(0))-1)
'
IF PEEK(BASEPAGE+149) AND 16 ! dta+21=attribute (if it's a directory)
IF x$=y$
a!=TRUE
ENDIF
ENDIF
INC i%
a%=GEMDOS(79) ! fsnext
WEND
' *n%=i%-1 ! next index with data, commented out, because it only
' works interpreted but not in the compiler!!!
RETURN a!
ENDFUNC

' use it like this:

file$="AUTO" ! set it to the name of the directory to be tested for
IF @does_this_directory_exist("*.*",file$,&H37,*dummy)
PRINT "Directory ";file$;" does exist"
ELSE
```

```
OUT 2,7
PRINT "No directory named";file$
ENDIF
```

Hope it helps
Robert Epprecht

The atari.org web server employs the http 1.1 protocol. As such, you will need one of the latest versions of CAB.OVL to make use of this feature.

If ya want a brief rundown on what http 1.1 is, just ask. :)

Regards
Danny (not connected at all with atari.org - just did some checks and came to my c onclusion).

1162. internal scussi leads

Newsgroup: comp.sys.atari.st
Date: 1999-01-17 00:00:00 UTC
From: binson@pikes77.freeserve.co.uk
Message-ID: <77sqt2$de5$2@news4.svr.pol.co.uk>
Source record: 86056

Has anyone any idea as to where these leads fit.
I have just fitted a scussi drive into an external case
that previously housed a smaller scussi drive.
The main leads are easy enough to fit and the new 4.5
gig drive has formatted and works fine on a Falcon.
There are smaller leads that connect to the id switch and
the activity led on the case. These fit to the new drive but the
problem is where. The removed smaller drive used different
connectors although there are some leads that look to fit the
new 4.5 drive which has a marked strip connecting block.
Anyone familiar with this.
Regards Bill

Are you sure you really lost one of them?

I turned my room upside-down when looking for one of these cups, when I finally came to the conclusion that it might only be necessary to use ONE for the ordinary return key. That is how I solved it anyway..

Just a thought,

Joakim

Brad Koda at Best Electronics has what's referred to as TT-Touch,
which are basically better-realized rubber contact cups. I've installed
these in my Falcon keyboard and, once you break them in, they perform
as advertised - not as mushy, and they make a nice satisfying click.

They're part no. CB101980 in the Best catalogue - you can phone
them at 408-243-6950 and ask if they have them in stock.

What does a FPU?

If I download the floating point emulation add-on,would it work on an
STE?

If so,what benifits would it offer me?

Thanks in advance,

Gordy.

There's been various rumours about upcoming CAB versions, but I've
recently asked Alex about them to verify.

The short answer is: no Java, no Javascript, no Style Sheets.

>Nor here , I can plan well into the 21st Century.

I tried to set the time/date to last minute of this year, wait a few
moments and view date again, it gave 01/01/2028. I replaced it with
2000, and again it reverted back to 2028. Being an accounts prg, it
revolves around dates for DD/SO's etc, so having year 2028 instead
2000 appearing as default won't be any use.

Unfortunately, I need to read OLD zip disks that have been
formatted in both TOS or DOS mode.. Magic_PC apparently redirects real
drives to virtual drives, and so cant see the drives under Magic_PC!
This MIGHT have worked, if I formatted them LONG AGO, but not after
the fact.

Hi Derryck!

Pedantic mode on/

Not quite: Your translation makes it appear that the program examines the
file itself and doesn't recognise its type; "unknown extension" means just
that (i.e. it only examines the extension).

Pedantic mode off/

Regards

/Peter/

I agree that EdHak is a great program. I've found no good substitute for
some of it's functions. It's only problem is that sometimes when
multitasking with certain other apps the mouse cursor will disappear.
EdHak will restore the cursor if you direct the mouse up to the top left
corner of the screen. This does restore the cursor, but it's still an
annoyance. I use EdHak on an ST, a Mega4-T25 and a TT030 and this is the
only problem I've seen.

I've bought quite a few unbranded disks too, and had no more trouble with them than the branded ones. The main thing to avoid is using HD disks in a DD drive. That is definitely not reliable. In fact HD disks in a HD drive seem less reliable to me than DD disks. I've had a lot of name brand HD disks that fail formatting, especially 3M brand. I've moved them to another drive or computer and managed to get them to format, only to have them fail a little later. My policy has become, at the first indication of trouble, or if they don't format on the first try I just get my data off and throw them away. At 60 cents or less a disk it's not worth the time spent or the risk of losing data.

Hey all
I have try to connect an st with tos 1.04 running cab 1.5 also 2.7 (demo)
and newsie 90.Sting connect with ppp.
Works fine no problem.
Now my friend want on the internet with his st but his TOS IS 1.02 and now i
have problems
cab 1.5 can t open urls(to long i think), newsie 90 can t open problems
with rsc file.Connection
with sting is ok.

Is it possible to upgrade tos 1.02 to 1.04 with software ??? So yes were can
i get it.
If no is it easy to change the roms and where can i get info to do this.
I have searched many hours on the internet but no succes.
Thanks for a reply.
Greetings Bonny

1189. Some Free Atari stuff

Newsgroup: comp.sys.atari.st
Date: 1999-01-17 00:00:00 UTC
From: michael@fastlane.net
Message-ID: <8485296D824D1478.661DE6E27753EB17.766758B040E4C0A7@library-proxy.airnews.net>
Source record: 86139

I have some stuff that has been lying around, and if you
want it, come pick it up (it's in the Dallas/Ft. Worth
area):

- 14" Multisync monitor. Not reliable at higher (e.g. Falcon)
resolutions, but worked fine for years on my Mega STe.
Can handle all standard ST video modes. Needs a custom
cable to work on a standard ST video port.
- Speakers that work fine sitting under a 14" monitor, but
too small for a 19" monitor.
- Prospero C compiler manuals + disks. Last version, I believe.
- Prospero Pascal compler manuals + disks. Last version, I believe.

I really don't want to ship this stuff out, but if someone
-really- wants it, and makes a decent offering for shipping
(remember, I have to run it down to UPS), I'll consider it.

If you're interested, email me or contact me at (817)427-2129.

Thanks.

Derryck, again,

hold on... aFTP for Sting is as good as for Mintnet, tho' the last one is slightly faster. Never had upload probs with it (running from MagiC).

The probs with aMail mite be the late added MagiC compatibility.. I understood it was for Mintnet only, then a Sting socket was supplied as well and next I hear it should run from MagiC as well. It does, apart from fetching and sending email (here).

Jo/Guillaume,

interesting at least. Pity I do have an Aixit board with 64 Mb EDO already
(expandable to 256 Mb, btw).
How about the upgrade: does it only speed up the 030 clock, or does the
bus get a boost too?

I have CAB 2.7 on my TT, where I use both IConnect (under MagiC) and
MiNTnet (MiNT/N.AES). There is no problem in using the same cache with
both OVLs.

> - new CPU at 64MHz

030?? I really doubt this, a 030 will probably not work reliable at
speeds over 50MHz. Remember that Centek originally advertised the CT2
as a 75MHz device, then 64 and the final produkt runs at 50...

> - fast RAM EDO (two Simms support, e.g. 32x2 =
> 64Mo TT Ram) accessable at thunder speed
> (64MHz rather than 16 of the genuine TT Ram)

That would rock! I really don't use my TT much, but with 64Mhz RAM
I'd probably prefer it over my Falcon/AB, atleast if I can get a
graphics-card for the TT. Doesn't the CT2 have a ISA-slot?

> To make it true, I must find about 20 people ready to buy this

Hi,
I have a spare TT030 4MB of STRAM and 80MB Hard drive
for sale.
It has TOS 3.06 and HD Disk drive.
It also comes with a MEga St keyboard and a mouse.
It is in good working condition.

Asking $175 CDN$, or 120 US$
Shipping is Extra.
Prefer to sell within Canada, but international sale
may be possible.

If you are interested, Please let me know by :

email:
nima@canada.com

or by calling:

An FPU is a motorola 68882 chip that could be addes to some atari
computers (STE/Mega STE/Falcon) to accelerate floating point
calculations.
>
> If I download the floating point emulation add-on,would it work on an
> STE?

Dunno...

>
> If so,what benifits would it offer me?

It allows you to run programs that require an FPU. This is emulation, so
I suppose it runs much slower than the real FPU chip.

Does starwriter have an ASCII export function ?

If so, then export the ASCII files to a DOS formatted 720K DD floppy
disk.

You'll regret it ! sooner or later !

Why not replace/fix the monitor ?

> Is there a better way to port to the Pentium other than saving creator files
> as midi standard to a floppy and importing it to cakewalk?

Not really. You can also try transmitting them thru MIDI, but the result
will be the same. You will lose all the creator-specific data.

>performance on newer/upgraded machines.

Anthony Jacques has already done some work one STOS espically in the area of getting it to work on newer machines, his Beta207 version has been fixd to run with all know TOS Versions, he has also written a Falcon extension which has commands to utilise the Falcons hardware.
You can check out/download them from his web site at
http://www.users.zetnet.co.uk/jacquesa/atari/index.html .

>Well I just downloaded them this evening. It'll take a while to go through
>them. I really want to find out why the text cursor dissappears in
>monochrome mode. Maybe find a fix for it.

Is this STOS itself or a progrmme you have written?. As I can't use Hi res I don't know if I can advise you on this, I would assume that it is because the cursor has been asigned to a Pen number or colour that is not available in Hi res, I beleive that pen one is Black and pen two is white this could apply to both items.
If it is only in programmes you have written and complied that don't work try looking at the compiler options as annoyingly there are some items there like Mouse and Cursor on/off that override the commands in the programme and so it looks fine when running as a basic file under STOS but when it's compiled appears to have a few problems.
I found this out the hard way (with a little help) as the complier options are not something I would have thought of, personally I can't understand why when you have commands like Show/Hide the mouse that you can place into your programme if you don't want the Mouse visable that there are options that allow you to do the same thing but permantly (regurdless of the programme commands) in the compiler options.

I think there is a common solution to both of these problems. If I
remember correctly the <RETURN> key only uses one cup even though
there is room for 2. (Or is it that it only uses 2 cups when there is
room for 3????) Perhaps someone will confirm.

can
>i get it.

Are you sure it's not a memory problem, maybe your friend needs more RAM.

Try visiting http://ldg.fatal-design.com/ and follow the "International TOS Roms" link from here you can download various version of TOS in file form for use with Fatal Designs Atari emulators Pacifist and WinSTon, if you place these on a floppy and place the floppy in the drive at boot up that may do it.
The usual root taken my most Atari users seems to be adding a upgrade board to iirc TOS 2.06, I think these boards are switchable so you can return to your origional TOS verson should some of your software not run with the new TOS Version.

>If no is it easy to change the roms and where can i get info to do this.

This may not be possible, if it is like mine the ROMs are soldered into the PCB making them very diffucult to get out, I know what I'm doing with a soldering iron and I won't even attempt to remove them as you really need specialist equipment to remove them.

>I have searched many hours on the internet but no succes.

1222. bad sectors

Newsgroup: comp.sys.atari.st
Date: 1999-01-18 00:00:00 UTC
From: Kees Wiebering <c.a.wiebering@ctit.utwente.nl>
Message-ID: <36A30836.EA84E6A9@ctit.utwente.nl>
Source record: 86009

Hi all,

I never had any problems with my harddisk until now. I used the markbad option, for marking bad sectors in logical diskdrives. A option that is provided in the Harddisk Utility that comes with the Mega STE. But now the logical drives on which I used this option are totally wrecked, although the program did not find any bad sectors. The filenames are still there, but no contents anymore.

Anyone had exerience with the same problem? Is there anyone who kows how to recover the data (I think it must be still there).

system: Mega STE 4MB, 48MB HD.

Greetings, Kees Wiebering

Not entirely correct ;-)

http://www.esat.kuleuven.ac.be/~pcoene/index.html

> Get MiNT, which give you a Unix-like environment, and remains TOS
> compatible. You do need a HD.

Yup, I'd definitely prefer this over Linux on a 68k-machine.

It all makes me wonder where this speed is coming from, in fact I doubt
that there is any difference in performance, it's just something to fool
programs :)

AM.

I think therefore I AM.

Erm... That will not work. You need a tos loader program to do that.

Are you sure ? I've never seen soldered ROMs on an ST. Which machine is
it ?

There should be either 6 or 2 ROM chips, but always socketed AFAIK.

No it won't.

> You might be better off looking for a second hand ST, 520STfm's tend to have
> TOS 1.02 (1.2) and STE's tend to have TOS 1.04 (1.4)

Nope. STFM's tend to have 1.0 or 1.04. STE's all have 1.06 or 1.62. I
think the minimum required for STinG is 1.04. You definitely need
HSModem too.

program
>
>It only works with IConnect, so I can't use it as a client under STING
>When using it in combination with CAB you're stuck with a weird ASH CAB.OVL....

I don't know (because I've deleted CAB2.5) if it's a problem with CAB2.7 or
the overlay, but the only way that I can now access my offline cache is with
the IConnect version of the overlay. If I use either of the two third party
overlays I have to wait for a timeout before it will start to load pages to
browse from the cache.

This is bugging me!

>The newsgroup-section of the program can use a update. It's not possible
>to see the headers of the different postings, wich means You've got to
>download every message. With the atari-newsgroups that's not really a problem,

No. TBH if I subscribed to many more groups there wouldn't be enough time in
the day to read them! :-)

>but in some newsgroups they've got the habit of attaching big files at the postings
>There is no way to say that you don't want these, so sometimes downloading
>the newsgroups can take ages....

I was under the impression that it would ask you if a file was over a
certain size?

>I do like the email section, it is straightforward and very intuitive=

>looks like at first glimpse,=
> but you've got to find out all for yourself (Keyboard shortcuts etc)
> aren't documented, neither is the fact that you can change fonts etc..

I took a look at ASH's web site last night with the translation engine at
altavista, interesting description but the handling charges for orders
outside of Germany are steep, plus they don't take credit cards.

>In general (don't flame me) I like the ASH products, but this program is
> really something witch shouldn't have been released, they should have
>included it in CAB 2.7.....

Trouble is, it (like Fiffi) would probably not be translated...

Yes, AFAIR it was a review copy that managed to escape.

I have it running here on my Falcon - it doesn't like multitasking tho', so
has to be run as a singleton under MagiC.

>main problem with it was that it only flood-filled that space

A good thought!

Paraphrasing from Best Electronic's TT Touch installation sheet:

"There are 94 grey/black silicon contacts in eash st/ste keyboard, 95
plastic shell cavities and 97 possible locations on the PCB. Looking at the
PCB the return key has the top silicone contact missing and Left shift key
is missing one contaact left and right side (contact only in the center)."

HTH.

1236. Falcon for sale

Newsgroup: comp.sys.atari.st
Date: 1999-01-18 00:00:00 UTC
From: bsummer@delphi.com
Message-ID: <Rfb26+S.bsummer@delphi.com>
Source record: 86023

Atari Falcon For Sale:

Atari Falcon with 84 meg internal HD,14 megs of RAM,
math co-processor installed, and RGB,VGA monitor adapters,
with manual and box. HD is loaded with all ORIGINAL
Falcon software, inc. Atariworks, plus much more.
Price in USA $650.00 plus shipping/COD.

I also have the external TOAD Syquest 88/44 hard drive,
which was a perfect complement for backing up internal
HD. The Syquest will write to 88 meg carts, and read 44
also.It comes with cable, and 7 - 88 meg carts.
There's a 14.4 ext. modem if needed.
The price of the Falcon and external HD stuff is
$775.00 plus shipping in USA/COD.

If there is anyone in the NYC area, that would be interested
in picking up the Atari Falcon, instead of mailing it, I will include
an Atari SC1224 monitor in excellent working order, for
free.

If interested, please leave Email for Barry Summer at:
bsummer@delphi.com

Happy holidays, everyone!!
Barry

Atari software for sale:

Here is a huge grab bag of ORIGINAL Atari software.
I believe only 2 or 3 are Falcon Specific. All have docs unless
specified otherwise.
Over 15 programs/games for $50.00, incl. shipping in U.S.A.

Diamond Edge
Diamond Back 3
ICD-Pro Utilities
Image Copy 2
Stalker 3
Word Writer ST
Compo C-Font
Cyber texture
Certificate Maker
DEluxe Paint
View II
Awesome Arcade Pack(Xenon,Blastaball,Sidewinder)
ANM LINK-Falcon
Pinball Dreams-Falcon

These 2 have no docs: Degas Elite and Gauntlet 2.

I really don't want to mail things separately, so I've made the price
really low.
If interested leave e-mail for Barry Summer at:
bsummer@delphi.com

THank you!!

Hello to any TT user:

Listen please: it now exists a possibility to boost the TT,
it's just like a Centurbo2 but for the TT030 ... not already
done but Centek could adapt their Falcon Centurbo2 if there
are enough interested TT users !!!!!

- new CPU at 64MHz
- fast RAM EDO (two Simms support, e.g. 32x2 =
64Mo TT Ram) accessable at thunder speed
(64MHz rather than 16 of the genuine TT Ram)

To make it true, I must find about 20 people ready to buy this
card at a price of 1490 FF (about US$ 300 ... I think)
(card, cpu, but without RAM).
I'm now ready, but I must find 19 other TT030 users.
This really should boost your computer !!!!

Guillaume.

A friend of mine reported that also. Downloading files works just fine but
uploading results into a crash.

With MiNT ofcourse aFTP works smoothly. I can upload for instance 100
files (2.3 mb) without any hassle.

One thought. 1490 FF is a lot of money for a product we don't know if it
will work properly.

I have been a big fan of the Atari 8-bit for almost two decades... now I find myself with a ATARI ST!! Only what... a decade after it's release... better late than never right?

Became the newsletter editor for AUNT (Atari Users of North Texas) and found myself with the following system...

Atari ST 520 upgraded to 4 megs
Harddrive (Seagate) that seems to be partitioned into three / 20 meg sections.

Interesting unit. Been a Macintosh user for years and I see many striking similaries in the desktop design.. and yet it functions like PC in it's disk format and file system. Weird!

Anywho.. my challenge it to get this baby web surfing capible, and to where it can read usernet and e-mail messages. Also looking for a good graphics/image coverter and a unarchiever that can possibly handle stuffit or zip format.

With those above that should have all I need for a fully functional computer system. :)

Also, this setup comes with a Chinon CD drive... how do I get the audio function (to play Audio CD's) to work?

Like I said, if I could get this baby to do most of the things I need... my Macintosh can take a vacation. ;)

Talk soon,

Doctor Clu

Proud User of.. (in chronological order...)

(Sol Terminal '77.. hahahaha...)
Atari 400/800/800xl/130xe
Macintosh 128K Original- Performa 550
Newton MessagePads 110-2000+
Atari 520ST

Good machines every one. I have owned a PC and other machines..
... but really now... :)

<thirsk@telusplanet.net> wrote:

>Has anyone written a GFA Basic Routine to test for the existance of
>a directory. I need to test if certain directories exist, and have never
>done this before.

Required actions are ...

Save Current DTA (Fgetdta)
Set New DTA Buffer (Fsetdta)
Enquire Directory (FsFirst)
Restore Old DTA (Fsetdta)
Check Result

In C the DTA buffer is layed out as follows. It is 44 bytes and you
should never attempt to alter anything within it.

```
typedef struct {
char d_glob[12]; /* GEMDOS wildcard string from Fsfirst */
char d_mask; /* Attribute mask from Fsfirst */
char d_dirent[4]; /* Offset into dir, MSB first */
char d_dirid[4]; /* Ptr to dir structure in GEM mem */
char d_fattr; /* File attributes */
long d_tandd; /* Time and date words */
long d_fsize; /* File size */
char d_fname[14]; /* File name */
} DMABUFFER;
```

```
NAME BYTES (inclusive)
d_glob 00..11
d_mask 12..12
d_dirent 13..16
d_dirid 17..20
d_fattr 21..21
d_tandd 22..25
d_fsize 26..29
d_fname 30..43
```

Thus you need something like this pseudocode ...

```
LONG old =Fgetdta();
LONG new =Obtain44ByteBuffer;
Fsetdta(AddressOf(new));
result = FsFirst(path,attr);
Fsetdta(old);
```

```
... where 'path' is a C type string (ie nul terminated) and is the
thing you're looking for. 'attr' is the attributes word: it needs to
be 16 to locate folders. ie
result = FsFirst("\wibble\fred",16);
would attempt to ascertain if the entry 'fred' exists.

We're not quite done yet. Due to the way Fsfirst (and its usual friend
FsNext) work, it'll find both a file called 'fred' and a folder called
'fred' so there's a bit more code needed to tell which of the two
'fred' actually is. Access the DTA structure for this ...

BOOL IsFolder;
BYTE attr_out =d_fattr (ie byte at offset 21);
IF (attr_out AND 16)
THEN IsFolder = true;
ELSE IsFolder = false;

'result' will be zero if 'fred' was found. Simply use 'IsFolder' to
modify 'result' so that it won't return zero success when it actually
found a file called 'fred' ...

IF (NOT IsFolder) THEN result = 1;

All that need be done now is return 'result' to the caller. Personally
I'd invert it so that it is "true" on success and "false" on failure.

Incidentally, if you can read C it's a lot clearer ...

bool
_fd_dirprs(dname)
char dname[];
/*[ bool _fd_dirprs(dname)
char dname[];

fd_dirprs() returns true if the specified directory exists and false
if it does not. It uses Fsfirst() and therefore can accept a wildcard
specification. It will also detect the root directory which FsFirst
does not. The root can be specifed as a: or a:\
]*/
{DMABUFFER *odta,
ndta;
bool retv;

/* <IGNORE> */
if (dname[1] == FD_MSEP_C) {
if (!_fd_drvprs(dname[0])) return false;
if (dname[2] == NUL) return true;
if ((dname[2] == FD_DSEP_C) && (dname[3] == NUL)) return
true;
}
/* </IGNORE> */

odta = (DMABUFFER*)Fgetdta();
Fsetdta(&ndta);
```

```
retv = (Fsfirst(dname,FD_DIR) == -AE_OK) ? (true) : (false);
if (retv && ((ndta.d_fattr & S_IJDIR) == 0)) retv = false;
Fsetdta(odta);
return retv;
}
```

The IGNORE bit isn't relevent to this problem but I left it in for its interest value. FD_MSEP_C is the "Media Separator Char" (the ':' in a pathname) so it'll come as no surprise that FD_DSEP_C is the Drive Separator Char '\'. FD_DIR is the value 16, as is S_IJDIR. AE_OK is the value zero.

I don't pretend to understand much GFA but ...

>FUNCTION does_this_directory_exist(file$,y$,code%,n%) ! y$=name. code%=attribut
> $F%
> LOCAL i%,a%,x$
> a!=FALSE

Save the old DTA here.

> VOID GEMDOS(26,L:BASEPAGE+128) ! setdta

This is where the DTA exists by default anyway. Try using a temporary
DTA allocated locally to this function.

> file$=file$+CHR$(0)
> a%=GEMDOS(78,L:VARPTR(file$),W:code%) ! fsfirst

Moreover, basepage+128 is the command line, FsFirst has just destroyed
the first 44 bytes of it. ;-)

Derryck,

it's not CAB 2.7 (for what I'm worth), it's the CAB.OVL u're using. I went
from 1.2904 to 1.30xx , now 1.3015 (? simply lost track) and am still
using CAB 2.5 and the same happens here. First time-out, next get the
cache. Maybe I'll go back to 1.2904... This is on Sting, btw.

Drat. I can understand no Java or Javascript, due to machine limitations,
but I'd have thought style sheets were a possibility for anyone with NVDI
or GDOS installed.

Thanks for the info anyway.

Hello all Atari 16/32 users in the Cleveland area!

A bunch of us here want to get an Atari 16/32 group
started here. We already have a place for our meetings.

Any interest in this, please contact me via email.

Regards,

Jim W. Krych

p.s. Ooops-this is Cleveland Ohio, USA!!!!

The only thing I can think of at first is that you are using
the right cable 25pin all wired straight through, not a serial
cable that probably has some lines missing.

1264. Midi Converter

Hi,

I would suggest "TT-Touch" (I think that's the right name). Try Keith Scroggins. He's the guy who got all of Toad's inventory and is selling it at good prices. It made a very nice improvement in my Falcon's keyboard. It simply replaces the original grey rubber cups under the keys with pink ones that have more resistance to them, and they snap down with a more precise feel. They don't make any clicky noise, however. The ST/ Falcon keyboards do have a location or 2 that LOOK like they should have a cup, but actually DON'T. Follow the instructions that come with the package. If I recall correctly, the return key has places for 2 cups, but only uses 1.

Keith's Atari Hardware & Software Sale!:

http://www.radix.net/~atari/

Hope that helps,

You can't. You need an 030 + FPU + MMU to run Linux.

Get MiNT, which give you a Unix-like environment, and remains TOS
compatible. You do need a HD.

Since you own a PC, it might be a good idea to learn how to use DOS.

The command line should be:

"C:\WHATEVER\THE\PATH\IS\PACIFIST.EXE /ini <filename>"

It's time to upgrade!!

Do you seriously still use a disk TOS on a 512Kb machine ??? You must
have 256Kb free once the desktop is loaded.

Another possibility is a problem I've run into a number of times -- mislabeled files.. I've come across a number of images on the web that have a ".jpg" extension but are actually GIF files.. some image viewers don't have a problem with this and look at the file header instead of the extension, but some viewers get confused and won't display the image..

uups, didn't see this one.
(well in fact I didn't care, I used to check the command line as one of the first things in a program and did not touch it later on)

BTW as I remember now, the code was not written by me, but mainly copied from Frank Ostrowski (the author of GFABASIC). I had forgotten this, because I had used it a long time in some of my progs. Sorry for not giving him credits in the first posting.

Message-ID: <36a51064.3185074@news.cortland.com>
Source record: 85902

Greetings!

Okay, so here's the deal. I auctioned my Atari Mega ST2 system off on eBay. Then the top four (yes, all four!) either flat out flaked out or had already purchased systems by the time I figured out that the first gut was a flake. Bad Karma! Because I want to avoid any more eBay charges, I am going to offer it here for a price substansially lower than the auction price - $125.00 or best. You pay the actual shipping costs to be calculated. It's all boxed up and ready to go. The system is:

Atari Mega ST2
Atari SM 124 Monitor
Keyboard, Mouse, power and connecting cords.

All in great shape, virtually no scratches, or blemishes. All works perfectly. No software (sorry, if I had some I'd probably keep it!). I don't know how to tell which version of TOS is on it or how much memory (I'm guessing 2 megs) but I'll be glad to try to answer any questions you have.

You can see a picture of it at:

http://members.tripod.com/~CameronVinyl/atari.jpg

The address is case sensitive.

Please reply by email or phone.

Absolutely! Never any problems here with it. Use as large a buffer for
it as you like, if used alone; or restrict it accordingly in multi-
tasking. If using it for editing on the internet, I suggest adding
two or more zeroes to its right margin config, to avoid word-wrapping.

Cheers, Charles.

DC> warning in the HDDRiver readme.

Well, it used to work lovely under MagiC 4... But ATM, not having
tested further it seems either some obscure combination of settings
(in CBHD) or the way it does b/g DMA are to blame. Or some internal
difference in MagiC 6 compared to MagiC 4 :->

I'm going to try out the HD Driver demo too...

DC> >Anyroad, I'm still not finished testing. But it'll have to wait until

Tim,

Yes, I own and use Midi Mouse. It turns the Atari into a very cool
instrument and is very easy to use. It's so simple that my 4 year old
can have almost as much fun as I can :)

Neron

P.S. Thanks for Laurie's web site.

1287. Returning ST user looking for suggestions

Newsgroup: comp.sys.atari.st
Date: 1999-01-19 00:00:00 UTC
From: Jeff Jewell <jjewell@ix.netcom.com>
Message-ID: <36A550B0.EF36CBF2@ix.netcom.com>
Source record: 85911

I finally found the time to unpack and set up my old Atari STs, even bought another hard drive. I'm curious about some of the new OS alternatives and I'd like to get any suggestions you might have for my set up.

I've got a MegaST2 (Tweety Board) and a home-brew 85meg drive (ICD adapter). I'll probably use this as a MIDI and Spectre GCR machine, connected to an SM124 monitor. By the way, where can I find current information on Spectre. I've got version 3.0 of the GCR software, and I remember having System 5.0.4, or something like that. I've got four disks that say System 6.0.5, but I remember not being able to install them to my hard drive, although I can't remember the symptoms at this point.

I've got a 520STfm (2.5meg memory) with an SF314 to be connected to the big screen tv as a game machine.

I've got a 1040STf and a MegaFile30 hooked to SC1224 and SM124 through a Monitor Master that I want to play with OSes on.

I hate using my "biggest" ST, the 2.5 meg 520STfm, as the game machine, but it's the one with the rf modulator. Will a stock 1040STf even run MiNT and MiNTnet, and that stuff?

I've also got a 1040STf with some keys that don't seem to work. Is there a cleaning procedure for those keyboards?

Thanks for any suggestions,

Jeff

Hi, well this ain't the problem here. Loaded the file into QED (binary)
and it displays JFIF headers alrite.
Jpegtran and djpeg.ttp's complain about an unsupported marker type 0x04...
they both start writing but end up with a 0 byte file. Graftool, Gemview
and Smurf 1.04, MGIF, Stella don't load at all. Gonna give it a try with
1stGuide now.

Indeed, since the Kaffe freeware Java VM has been ported to MiNT.

> > but I'd have thought style sheets were a possibility for anyone with NVDI
> > or GDOS installed.

It's not a question of NVDI.

Basically, Java/Javascipt requires a text parser that is completely
different from the HTML parser. Two different ones, in fact.

There is also the question of RAM capacity and CPU speed to handle
these 2 extra parsers. The ST is already left in the dust, when it
comes to that. TT or Falcon could manage, but just barely.

Trivia:
why are there 3 Atari clones on the market, including a brand new
model, when there are so many second-hand TT and Falcon out there?
That's a no-brainer.

thanks but what I am looking for is some plans or online files that describe some way to upgrade the original 520ST. I thought maybe there was still some way to get information like that, but I find information on the web for atari's later models like the falcon (which I've never seen or heard of anyone actually using this machine in the united states btw)

Anyone try this NOS thing for the ST, it some kind of shell, which may provide PPP access to the internet on an 512k ST?

>>
>> Does anybody know a U.S. site that sells the Milan? Anybody know how
>> many have sold already?
>>
>> Thanks,
>> Andy Blakely

The impression that I have gotten from talking to people is the
following:

1. Just about any currently operating dealer in North America
would like to be able to sell Milan's

2. A large number of consumers in North America would buy a Milan
if they didn't have to import one from europe.

3. The Milan manufacturers don't seem interested in a North
American outlet at the moment.

Now before I get flamed over 3, I think I can guess the reason.
Sales/Production. It is very possible that they are selling most if not
all of the Milan kits they can make at the moment in europe. If this is
true, I imagine their thought is that it's better to supply the markets
they are already in, than to expand into new ones. Remember it was
something similar to this that atari used to do and sometimes fail to do.
They aren't a major manufacturer in the global sense and probably have a
fairly small production schedule. It is probably somewhat a questionable
prospect to increase this production schedule, unless it comes at very
litle extra cost. What would they want with 2000 milan mother boards if
the market for them dried up tomorrow?

>
> Thanks, Creme
>
>.
The Only way I know of is to load the .SNG file into the original
program it came from ...in this case EDIT Track, then SAVE AS a
MIDI FILE. For that you will need an Atari Computer.

For Steinberg 12, there is a function in Atari Cubase that allows
you to export Pro 24 songs which are the same format as "12". Then
do a SAVE as a Midi file.

Once you save the midi files, just transfer to PC formatted discs
so the PC can read them. Atari reads PC formatted discs.

As far as a seperate utility prigram..I would be interested MYself
if they exist, but for now..you have to do it "the hard Way"!

I know this is not what you were hoping for. Perhaps there will be
another response . Hope this helpls anyway.

1300. Music Mouse Still Available!

Newsgroup: comp.sys.atari.st
Date: 1999-01-19 00:00:00 UTC
From: tconrardy@hotmail.com
Message-ID: <78164h$f9d$2@news.ncal.verio.com>
Source record: 85964

Hello All:

This is to let you know the existance of a special Music program called "Music Mouse" that is still available for Atari computers by the programmer Laurie Spiegel.Originally coded for the Mac in 1986 it was ported to the ST platform in 1988.

This program actually turns the ST into a musical instrument in it's own right with complete control in the hands of the performer. Basically it takes mouse movements and transforms them into 4 moving axixs inside a grid that can be assiged different midi channels & sounds with keyboard keys for controller messages,tempo,transpose, and a host of other features. In three words.. IT"S PLAIN FUN! Musicians as well as non-musicians can benifit from this simple to use yet deep program.

For more information check out Laurie Spiegels web site:

http://www.dorsai.org/~spiegel

For Specs:

http://www.dorsai.org/~spiegel/ls_programs/mm_spec_sheet3.html"

Or send $29.00 (which includes the shipping!) along with your return address to: Aesthetic Engineering, 175 Duane St.. NYC, NY 10013.

In my own applications of Music Mouse; I run it on my Mega Ste and record directly into Cubase on my TT030. I can run several tracks of MM material, then add percussion and other parts as the piece needs it.Music Mouse also works on the TT with the cache off .(St Hi or ST Med Res.) I cannot recomend this program enough for any Midi Musician using an Atari!

Basically I am just helping out Laurie to find good homes for her supply of Atari Music Mouse as in her own words:

"Few things are more sad than homeless music rodents."

I would also like to ask if anybody has used this program, as it has been out for a while! But if you haven't ...NOWs the time to get it!

> Java/script!

Java and Javascript are two different things. Both can be done, but it will...

a) take a lot of effort to implement.

b) be very, very slow.

Kaffe, a Java VM with JIT compiler has been running under MiNT for about a
year now, but considering the fact that the simple "Hello world"-program
takes one minute to compile (JIT) and 5 seconds to execute on a TT suggests
that it's not very practical... Oh, it needs atleast 16Mb *free* mem too.

Javascript is more realistic, but requires a lot of effort since no free
Javascript-implementation exists.

Any speed will do, but get a 33MHz, you can then speed it up to atleast 66MHz
(75MHz should also work). Take a look at 'www-atari.nvg.ntnu.no/fpu/' for
instructions.

>where it can read usernet and e-mail messages. Also looking for a good
>graphics/image coverter and a unarchiever that can possibly handle
>stuffit or zip format.

No probs. You can do it all with freeware:

HSMODEM - to fix some probs in the serial ports.
STiK or STiNG to provide dialling and TCP/IP (STiK will only do SLIP
connection, STiK will do both SLIP and PPP)
Newsie - for news/e-mail/ftp
CAB 2.7 demo version for web browser
CAB.OVL from Dan Ackerman

You can use STZIP for .ZIP archives. I don't think the Atari supports
stuffit.

> Also, this setup comes with a Chinon CD drive... how do I get the audio
>function (to play Audio CD's) to work?

If the Chinon supports direct sound sampling you can use SPiN for the
driver and (e.g) Mucke to do the playing.

Good luck.

For most questions, including internet setup: http://quickfaq.atari.org

I don't remember ever seeing a .sit unarchiver. The common archive
formats on the ST are .zip and .lzh, followed by .zoo and .arc. You can
get these on most FTP sites, as well as 2in1 which is a nice GEM
frontend for all this.

However, for web surfing, you'll probably want to switch of graphics,
and stick to a hi-res monitor.

Those ARE in the FAQ!

Section 3.1 How can I upgrade memory on my Atari ?
Section 3.2 How can I connect a hard disk drive to my ST ?
etc...

You can also look here:
http://www.geocities.com/SiliconValley/Way/8016/atari/sthard.htm

Maybe you could be more specific as to what type of upgrade you're
looking for.

> there was still some way to get information like that, but I find

Of course there, you just have to look in the right places. You'll often
even see TTs or Falcons for sale in this newsgroup.

Aarghm! What sort of information have you been reading ?

NOS is ooooooold. Get STinG and some client software.

|
|
| I've never noticed any unstability and I've used it for years on
|everything from a ST->TT including a Falcon. Under TOS 1.0 - 4.04, Magic
|and MiNT with AES 4.1. Only problem I've ever had is that you can get a
|conflict with it and NVDI if you don't have NVDI configured properly.

I have had a query from the author as to the version I have and the difficulty. The version is 3.01, the original difficulty (in 1993) I don't remember but when I got it out of the drawer last night and used it on a Hades, it crashed when I was typing into an opened window.

It may be that I have not got NVDI set up right - on the Hades I have GDOS checked and Error Messages un-checked. I do not remember what the settings were on the TT in 1993.

Oops, I just realised that you meant "in only 512K", in which
STinG+client probably wouldn't fit.
Really you should upgrade the RAM.

There was a game called Zub on the Spectrum used parallax scrolling.

There used to be light guns on most of the 8-bit computers as well.

And there was definitely a few games on the 8-bits with split screen.
Codemasters had one called ATX Simulator or something.

From: louis@holleman.demon.nl
Message-ID: <36a45df43ccadaf0@holleman.demon.nl>
Source record: 85977

Hi,

lately I come across several pictures on the Internet, JPG's, which won't
load in Gemview, Graftool or several other apps.
Some of these can be reworked by Jpegtran, but on several occasions it
also complains about "unsupported markers"...

Is Microsoft perhaps setting yet another new standard of it's own here?

Just wondering whether others do experience this phenomenon too or not.

for the web surfing/USENET part, I'd suggest surfing over to
http://hem1.passagen.se/atari/ , this is Mille Babic's web page where
he maintains a listing of all the different things you'll need to get
started. You'll need a TCP/IP stack (STiNG), a web browser (CAB either
1.5 which is freeware or the 2.7 demo which gives you some more
options) and NEWsie, which can give you e-mail/ftp and USENET
capability... but there are many options you can find there...
>
> With those above that should have all I need for a fully functional

if you want to play CDs, Alexander Clauss makes a nice CD-player
that looks great and allows you to keep a database of your CDs that
will call up the titles automatically - my Falcon is now the basis of
my stereo system :)

hello
For example,I want to destroy the beginning or the end
of a file.aif
1)
If I use the CTRL BackSpace key,the two parts of my
file.aif are destroyed only in my work window,
not on the HD.
How do I maintain this destruction on my HD
2)
If I use the 'shrink' menu,the beginning part of my file.aif is
destroyed on my work window,and on my HD,but the end part of my
file.aif is destroyed with some errors,there is a silencious gap
followed with the part I want to destroy

thank you RJ

From: atarist@xs4all.nl
Message-ID: <782lrqdhn4@news2.xs4all.nl>
Source record: 85990

On 18 Jan 1999 13:21:16, "AtariMad" wrote:

-knip knip--

>, it's just something to fool programs :)

Well, I think some explanation of the floating point situation on
Atari (TOS) computers is asked for. Now I go into teaching mode:

The first Atari computers had a lot of systemcalls you as a program
maker could use. Like setting the baudrate of the serial port for
instance. Nice, as a programmer you need not know how the hardware
works, where hardware adresses are and so on.
Also there is a filesystem. Opening a file is simple: you need not
know if it is on floppy disk or where ever. get it? Systemcalls keep
you away from the hardware specifics.
Now floating point. There are different ways to notate in bitpatterns
a floating point number. Mostly the choice is some IEEE norm. But you
are free. As I remember in GfA Basic they had their 'own' notation
format.
When you do adding, substracting, dividing or multiplying floating-
point notated values you need special software routines to do these
operations for you, the 68000 CPU has no special instructions for
that.

What do you do as a programmer: there are libraries thht give you the
fp. routines. You use those calls and link the code to the program.
So every vlavour of C, APL, Modula, Basic STOS etc. has its own fp
library resulting in programs carrying with them a lot of fp code.

Would it not be nice to have the best of those routines ready in ROM
(in TOS I mean)??? All those producers of programming tools have to
re-invent the floating point wheel again.

Then Atari came with hardware floatingpoint. All those standard
functions done not with software coding for the CPU but by simply
sending commands and data to the FPU, and waiting a very short while
until that chip is ready with the calculation. Nice: fp goes many
times faster. Everyone wants such an extra chip in his ST (just like
in those days everyone wanted a 'blitterchip', as some readers will
remember, but this is another story).

But from the point of view of the application builder: has the maker
of my tools a special library for using this hardware solution? After
a while they all had a library with calls so that the programmer did
not need knowledge about the hardware itself, the adresses in memory
etc..

But then the question is: my application will run on ST with and without hardware FPU. My application can be made in two versions: with and without, a method still in use as I look at the versions of PovRay or MiNT) or I can find a way for the application to test if the machine he is working on has hardware FPU or not.
If no, then I have to use the software FP functions. That means: I HAVE TO link that library to the program code and also the library for the hardware FPU.

The situation becomes more complex with the 68030 CPU+FPU (in TT and with extra cost also in Falcon) that knows about floating point functions and does then in hardware. That way is different from the way the hardware is driven in the ST.

So now an application has to find out about 3 ways FP can be done. This situation is really awfull.

There is only one good solution: place the FPU function in TOS as system functions. The most efficient way to inplement is:
if you want to add two fp values make sure the aplication uses the assembler code for this action.

If that code is not knows in your computer because there is a 68000 CPU only then an error occurs and the software emulation function in TOS is activated.
That function can test if there was found during startup an FPU chip in de ST. If so the let me call it 'driver software for that FPU' is used.
If we work on a TT or Falcon the assembler code is valid but can still produce an error because the hardware is not available (the FPU chip). (A situation that can also be detected at startup time.)

The result:
1. less code needed for applications.
2. no different versions needed (Yes/no FPU)
3. everyone uses the same FPU functions so error are more easy found
4. no hassle with libraries for programmers

and so on

This is what our FPU emulator tries to do.

Met vriendelijke groet,
Ronald van der Kamp

thanks but a MS box appears telling me it cannot find file

C:\WHATEVER\THE\PATH\IS\PACIFIST.EXE /ini'

Doesnt recognise filename I typed in. Is this because it is a shortcut
or a limited MSDOS that comes with W95.

Message-ID: <36a4e1d6.9686953@news.rbdc.com>
Source record: 85992

Hallo. I'm interested in buying an Atari STe. It must be expandable
to 4 megs with 30-pin SIMMs. It would be nice if a monitor is
included. Cables must be included, and it must be 100% working and in
decent condition (no missing keys, holes in the case, etc). I intend
to use this as a MIDI workstation. Please email to :
pwizard (at) rbdc.rbdc.com
for replies and offers. Thanks a lot!

The two Atari systems (Mega 4 and TT) are sold. Thanks for the many responses.

Here is the remaining ST equip./Software which needs a good home Offers are welcome. Shipping is extra for all items.

Here is what I have:

Misc. Pieces:

GTS-100 720 kb floppy drive for Atari St: $35

Migraph full width hand scanner
w/Touchup Software and OCR: $35 for this little package.

Practical Solutions Cordless Mouse (no battery door): $5 for the mouse.

RGB Tech. Synch Switch enables ST to drive a multi-synch SVGA monitor: $15

Migraph Hand Scanner tray (can't find the hand scanner): $5

Applications (all with orig. disks and docs) as priced or OBO or all for one price:

WordPerfect 4.1 $15
Pagestream 2.2b $20
Datamanager ST $15
Datamanager Professional ST $15
WordWriter ST $15
Easy Draw $15
Interlink $10
Stalker $10
Juggler $5

Cricit Point-of-sale small business program: $35 (plus shiping) OBO.

Games (w/boxes and orig. disks):
Red Storm Rising
UMS
Empire 2.0
Leisure Suit Larry
Terrorpods
$25 (plus shipping) for all these games.

Here's hoping there is someone who will take all of this for one price. Please let me know.

I think the answer is, no we don't have your damn game.

Even still, I wouldn't call it shit just because it's old - new games
with better graphics and sound don't make them any more fun. I had a
thousand times more fun playing games when I was a kid then I do now,
mostly because games now are more concentrated on being eye-candy
instead of focusing on game play. People spend more time looking at the
game then playing it.

>I never had any problems with my harddisk until now. I used the markbad
>option, for marking bad sectors in logical diskdrives. A option that is
>provided in the Harddisk Utility that comes with the Mega STE.

When you check a harddrive for bad sectors, there is usually a few ways this is done. One way and the most accurate check is destructive to the data on the harddrive - it basically writes (and tracks) random bits to all sectors on a disk and reads them back to see if the data written reflects the data read - if it corresponds, then the sector is presummed good - otherwise, writing one thing but reading something entirely different strongly points to a bad sector.

Other safe options of checking for bad sectors involve reading existing data, writing it back again, and then reading it a final time to see if the data reflects what was re-written. In this case, the data is never lost and you shouldn't experience any problems - if a bad sector is found (i.e. the data rewritten didn't write back successfully), the program should be able to keep your data by writing it back again to a clean area of the disk (and rechecking again to be sure). Another option is simply multiple reading of the same data to insure a consistent accuracy.

For your sake, I hope you didn't use the first checking option described above, although this is what it sounds like to me...Whenever using ANY utility that involves your disks and data be sure to RTFM or be prepared/expect to lose all your data.

From: Anthony Rau <raua@pinn.net>
Message-ID: <7867k5$bp0@netaxs.com>
Source record: 85862

I have a Atari ST emulator known as GEMulator 5.0 for windows 95/98. The emulator is on CDROM and comes with a ISA card with TOS 1.4 and TOS 2.6 installed on it. All you do is insert the TOS/ROM card into an open ISA slot and load up the GEMulator from the CDROM and your PC will run Atari ST applications 200-300% faster than a real Atari ST could run them! Supports any resolutions your system is capable of and makes full use of all your PC's hardware resources (cdrom, hard drives, floppies, scanners, modems, printers, you name it).

No longer have the room in my PC for the TOS/ROM card, so it had to come out. Asking $100.00 + shipping

Hello!

I have just put away my St from 1986 and have bought a Falcon.
It works very vell, but it is quite slow for starting up my "Gasteiner" SCASI-disk. It uses 23 seconds for getting in contact with the HD and so it lasts 55 seconds before it is starting again after have gone through maxboot!
(My ST just used a few seconds!)
Is it necessary that my Falcon is searching around for a disk or a HD for so long time?
And what can I do to solve the problem?
I will be glad for any help!

Excuse my English.

Following these directions with a Falcon and STe yielded no results via the Midi ports (I tried MIDI, MIDINet, and Masquerading settings with STIKPORT.CPX). Are your instructions specific for the Modem port?

BTW, "No Results" means that both computers start "Online" under the Dialer, but Ping away without result at each other.

>How do I maintain this destruction on my HD

If you're in the Pool, you delete the actual file from the HD and can't get it back when you press CTRL-BackSpace.
However, if you still have parts of the file in a Part in the Arrange-window, you get an error message saying that you can't delete the file when you press CTRL-BackSpace.

>2)
>If I use the 'shrink' menu,the beginning part of my file.aif is
>destroyed on my work window,and on my HD,but the end part of my
>file.aif is destroyed with some errors,there is a silencious gap
>followed with the part I want to destroy

Instead of using the "Erase unused" function in the Pool, it's often better to record the track to a new track using the Punch IN/OUT between the left and right locator - and the Mix option in the Hardware setup menu to make a permanent mixdown. Some computers have worse problems than others with the SCSI-bus locking up for a while before the operation continues, even though the CPU clock modification has been done and in those cases it's much faster to re-record than to use "Delete unused".
There is a bug in CAF that may cause strange things, like old recordings reappearing in spite of deletion, or digital noise or other strange things when you make a new recording. This bug may be the cause of your problems at the end of the part you're working with. The easiest way to go around the bug is to change audio track to another than the one you want to record on and then back again, before each recording. Another way is to choose "Reset devices" in the menu or changing back and forth once between digital and analog input in the Hardware setup menu.
For some other tips about CAF and the Falcon, take a look at my homepage.

Well, Jo Even Skarstein's post says it all basically. You'd need one hell of a souped up Falcon/TT in terms of both RAM and processor speed to make it viable. I never cease to be amazed at what Atari programmers can squeeze out of the machines, but Java may be stretching the envelope a little.

> Draconis have left a greyed Java console option in one of the menus in
their
> Light of Adamas browser. Obviously they believe it can be done...just not
> right now! :-\

Emphasis on greyed out. If they can do it (and believe me, I'd love it to happen), it will probably only work on very high-spec machines. Interesting that the Milan comes bundled with Draconis, or so I'm told. Has anyone got it working yet?

Meanwhile, no CSS support is frustrating as much of the CSS stuff isn't that far away from what is already doable in CAB using "normal" HTML. CSS just makes managing the look of a site much easier, in theory at least. Does Light of Adamas (where on Earth did they get that name from?) do CSS?

Cheers,
John

PH COUNT DOWN is a program which count down in number of days to any event.

Let your Atari count the number of days before Wintel machines freezes in the year 2000. This program (& your Atari) works beyond the next Millennial in year 2001.

Any SCSI host adapter that handles parity should do.

As far as UK dealers go, you have Systems solutions, Titan or The
Upgrade Shop.

I think only HD Driver handles the Zip's extra features, and disk
switching.

Did you put the quotes ? DOS needs them if you use long filenames.

Make a shortcut of pacifist.exe, right-click and Properties, then go and
edit the command line. That way you can make a shortcut for each of your
different Pacifist.ini files. No need for a silly GUI frontend.

Yes, but it'll be tight. It's tight even on my 4Mb Falcon. Why not rip
out the RAM extension from the 520 and stick it in the 1040.

Or put the 1040 in a box as a backup MIDI machine, and daisy chain the
megafile to the Mega2 up there. You can do your OS stuff on the Mega.

> I've also got a 1040STf with some keys that don't seem to work. Is
> there a cleaning procedure for those keyboards?

More like a bad membrane. Probably needs replacing, but that's difficult
without a proper source. What would you do with yet another machine
though ??? Keep it for when a power supply or a floppy drive goes belly
up.

Hi escaisey,

Try these FTP sites: dir.mcc.ac.uk/pub/emagic/LOGIC/UPDATES/ATARI

ftp.mcc.ac.uk/pub/music/emagic/LOGIC

I think the first one is better. It may take several tries to get through.
However, when you DO get through, the downloads are the programs only.
LOGIC 2.something, and LOGIC AUDIO 2.01 - the last version. If you need the
other files - font folders, etc. email me, and I'll see if I can help.

Have you tried cleaning the mildew off of your floppy? I recall some past
postings of how people managed to clean floppies with good results. Have
you tried to contact Emagic? They MAY be able to help.

Good luck,

Clayton Murray

AFAIK MidiNet is not fully implemented. You must use Midi treated as a
simple serial port. First set the MIDI port speed in the "Serial Ports"
cpx. Then open the "STinG Port Setup" cpx and select "Midi" (not
"MidiNet"). Then edit the General and Addressing "pages". Put in the
word "Midi" instead of "Modem 1" in ROUTE.TAB .

For the "Midi" port to show up in Sting you must use MIDI.PRG from
HSmodem in the autofolder.

>BTW, "No Results" means that both computers start "Online" under the Dialer,
>but Ping away without result at each other.

If you have a terminal program that supports the MIDI ports you can
check for any activity at all. Stalker is perfect for this.

Like with any other removable media drive you can change disks without booting. Except for the special read/write protection and auto park/auto sleep features (which are all supported by HDDRIVER) the ZIP is nothing more than a standard removable media drive.

The best ACSI<->SCSI adapter is probably Link 97, but it's possible that this (and other external everything-in-the-connector type adapters) will have problems with the Zip as the external Zip-drives AFAIK does not provide termination-power. It shouldn't be a problem if you have other SCSI-devices though, as these will feed the adaptor with termination-power.

As for software I would definitely recommend HD-Driver. AHDI will also work, but stay away from the ICD-drivers as these are not 100% AHDI-compatible. For removable media HD-Driver is *the* driver, as you can partition Zips in a special TOS+DOS format which makes them read/writeable on both PCs and Ataris. HD-Driver also has full support for the Zip, including password-protection.

Titan Designs (http://www.titan-bss.co.uk/) distributes both Link 97 and HD-Driver.

Swapping disks is not a problem, just be careful with write-caches on removable media! I have MiNT's writeback-cache enabled on my Zip, but I always eject the disk by software (Thing) to be sure that the cache is flushed before the disk is ejected.

Has anyone here played Prensorium?

It's shareware, and on FTP sites listed as PRENS.ZIP. This is the most innovative game I have ever seen. If you haven't seen this one you should really take the time to check it out. It is sort of a driving game, but each level is a new puzzle to solve. There are 50 levels so expect to spend a month or so getting to the end. I probably spent over a month working on the last level alone. For a long time, I thought level 50 was impossible to solve. Actually, my 6 year old son solved it first, not me.

Each solved level gives you a code to call up the next level. Until then you have to work on the levels in numerical order. The game itself is unrestricted but if you register it you get the tools to design your own levels.

Apparently few people ever registered even though it was only "a fiver". Martin Gibbins (the author) was quite suprised when I did, a couple of years ago. I have Martins 1997 e-mail address if you decide to register Prensorium. He's in the UK.

This is an excerpt from the doc file;

PRENSORIUM
****
Designed by Martin and Adrian Gibbins.
68000 coding, graphics and sound by Martin Gibbins.

Prensorium is an arcade puzzle type game, the object of which is to destroy all enemies on each of fifty levels.

Each level has a bonus which counts down. Once this bonus reaches 100, a siren is sounded as a warning. If the bonus reaches zero, things really hot up and bombs start falling from the sky.

After completing five levels, a bonus level appears. Complete this and you will be rewarded with two extra lives and a 10000 point bonus.
Failure to complete a bonus level does not cost a life.

Completing fifty levels is easier said than done. You start the game with three lives and no weapons. Killing enemies requires you to collect mines and/or lure them on to traps that are scattered around each level.

Each enemy killed score 100 points.
Each bomb that falls and doesn't kill you when the bonus runs out scores 10 points.

Control is with the joystick.

Gameplay takes place on a grid of 20 by 10 tiles.

Below is a list of all tiles, pick-ups and traps that appear throughout the game:

TILES
****

i) Plain tile - plain blue tile. Traps and mines can be laid on these tiles.

ii) Indestructable tile - as plain tile with a bolt in each corner.

iii) Barrier tile - as plain tile with yellow flashing barrier(s). You cannot walk through the barrier(s).

If an enemy is killed with a mine on one of these tiles, the barrier(s) on the SAME tile will be destroyed and a tile with a hole will appear (see below). Barriers on other tiles will not be damaged, even if they are close to the explosion.

iv) Broken tile - has a huge bottomless hole in it. Once walked on, the tile will fall away. It is not possible to stand still on one of these tiles and survive.

v) Enemy starting positions - marked with an 'X'. Mines and traps cannot be laid on these tiles.

vi) Forcefields - have moving coloured squares on them. Cannot be walked on unless the appropriately coloured key has been collected (see PICK-UPS below). Mines and traps cannot be laid on these tiles. Enemies cannot pass through either.

vii) Blockers - appear as a tile with a dome or a hole in the centre. Pressing the fire button on one of these tiles pops up a dome or pushes in a hole depending on its state prior to pressing the fire button. Enemies cannot walk over these tiles in their dome state.

viii) Direction restictors - as plain tile but have two grey arrows poiting either up & down or left & right. Movement is restricted to the directions indicated with the arrows.

ix) Escalators - appear as a plain tile with a single blue arrow indicating the direction. Once on an escalator, all movement is restricted until the end is reached. Traps and mines cannot be laid on these tiles.

x) Teleport pads - tiles with glowing blue circular pads. Activated using the fire button. Destinations are not random. During teleportation, you are invulnerable.

xi) Home base - where you start and where you must go once all the enemies are dead to complete the level. Press the fire button on this tile when all the enemies are dead to teleport to the next level. Enemies will not walk on this tile under any

circumstances.

PICK-UPS
****
All pick ups appear as blue circular objects with distinctive markings
and are collected simply by walking over them.

i) Shield - marked with a yellow flashing 'S'. Gives limited time of
invulnerability.

ii) Speed up - marked with two yellow flashing arrows. Doubles speed
of player. Unlike the shield, speed ups run out due to use and
not through time.

iii) Smart bomb - marked with a yellow flashing mushroom cloud. Kills
all enemies currently on screen.

iv) Mines - marked with a yellow flashing mine symbol. Gives an extra
five mines.

v) Score bonus - marked with a yellow flashing question mark. Gives
a boost to the score, funnily enough. Bonus is the level * 100.

vi) Forcefield keys - marked with coloured circles. Green keys allow
entry through green forcefields, etc.

TRAPS

i) Lava pits - unmissable. Enemies will not walk on a lava pit unless
you were or are in its sight. Once and enemy has been toasted, the
lava pit will cool down and turn grey. You can however walk over
a lava pit without a care in the world.

ii) The two-piecer - as its name implies there is indeed two parts
to a two-piecer. Each part has a colour bar at the back and two
glowing yellow spikes at the front. To kill an enemy with one of
these, both parts must be the same colour, one part must be
pointing down and the other must be pointing up with one
walk-on-able tile in between. Once an enemy has been fried with
a two-piecer, they crack up and cannot be picked up and used again.
Also the tiles that they were laid on become unmineable and no
two-piecers can be dropped on them.

All in all, not very many ways to kill enemies is there?!. Oh well, you'll
have to put you're thinking cap on and think of some more.

Here's a few hints to help you on your way :

Enemies become mad, thoughtless and stupid once they have caught
sight of you. Use this to you're advantage. Once they see you, they
will go for you until they have to stop or they have caught sight
of you again.

One click of the joystick in any direction will take you to the next tile. You can reverse direction once you are moving, but you cannot, say, go left when moving up or down.

Enemies cannot walk over parts of two-piecers.

Pause the game on each level and think about how to solve it before jumping in at the deep end.

If you run out of bonus, keep on the move, the bombs are possible to dodge.

Hello Jim,

j> a recent number one in the UK singles chart. The inside of the CD
j> sleeve shows a photograph of his studio. What's sitting in the corner?
j> An Atari ST! Not even a hard drive in sight.
Nothing to be astonished about. Maybe you are to young or you have missed
the
last ten years of music production/history (at least, but not only, in
Europe)? =;-)

In fact, in some hits you can also *hear* the ST as an instrument (typical

keyclick and/or S.A.M.), i.e. in some hits of Falco or the techno version
of
"Das Boot" (the computer voice saying "maximum velocity" and so on) ...

BTW: The original music of "Das Boot" and other films (at least the ones
of
the "German" Hollywood composers like Faltermeyer and Doldinger) were
produced with ST's too.

Greetings, Oliver

We are Microsoft - Resistance is futile!

Relax : that's not microsoft. This is known as "progressive
JPEG". You can translate them into regular JPEG with the JPEG 6
package (djpeg.ttp, I think) available on any atari ftp.
Katherine Ellis made a great front-end for that.

Originally, it was 75MHz because of a 25MHz bus (CPUx3), the
64MHz because of a 32MHz bus (CPUx2), then it was decided that
cpu 50MHz and bus 50MHz was the fastest because it's ok for 60ns
EDO, because it's the 25 MHz falcon bus x2 (32MHz would have
need a 16MHz bus).030 *can* run at 75MHz but not at 100MHz, ie
2x50MHz or 3x32MHz)

Your cheapest solution would be to buy another 520STFM. They can be had for
under $40 US (often less). There are rf modulator convertors, but they cost
more than STs. Your most enjoyable solution would be to purchase a used TT
or Falcon -- lots of options there.

It depends on the computer. It's pure crap on my
Falcon/Afterburner/Nova, but very stable on my plain TT.

Kobold, the commercial high-speed file copier, has a parameter called
'identical sequence'. Just one of the many features that makes this
utility indispensable.

Where should I look for this? And better yet, is there a resource for the actual installation? As I mentioned in my original message, I've got the 6.0.4or5 System Disks, but could never get them to install properly.

> > > I hate using my "biggest" ST, the 2.5 meg 520STfm, as the game machine,

The actual question was more about alternative operating systems, and if any would run on a stock 1040STfm; the big 520 got mentioned because it was coincidental that my 2.5meg machine is also my only machine that will connect directly to a tv.

> Your most enjoyable solution would be to purchase a used TT
> or Falcon -- lots of options there.

My original message in this thread was my first post here since I got textually smacked down for suggesting this newsgroup is of little use to users of actual STs. I made sure to phrase the message to indicate I was interested in seeing what I could do with the real STs I already have. Galen responds by suggesting I buy a TT. While this might very well have resulted from him not seeing my original post, I do find it a pretty standard example of how the ST newsgroup generally considers STs to be the retarded cousins of the TOS machines that have taken over here.

And finding a used TT or Falcon in the US, well, no, there's _not_ many options there. The lowest price I've seen for a machine that has all the parts to actually run has been over $500, when you find one available at all. I can't justify that investment in something that I'm just screwing around with.

So if anyone knows about where I could find a resource for Spectre GCR on an ST, or a place where different operating systems and how well they run on low-memory STs is documented, or a US source for user installable ST memory options, or even cool thoughts on what you're doing with _your_ ST, I'd love to hear from you.

If you just want to tell me how much better your TT/Falcon/Milan/MagiCPC setup is than my STs, I guess that's spiffy for you. But it's not exactly the help I was looking for.

Jeff

Tell me more about "tight." What can you do in 4Mb that you can't do in 2.5Mb, or in 2.5Mb that breaks in 1Mb?

Is there a net resource that compares OSes on different memory size machines? I've also got a MultiTOS disk, I don't see many references to that (did it become N.AES?).

Thanks for your help,
Jeff

SS> 1.15 68030 version as I remember) a strange problem was
experienced

SS> I found out the problem disappears when BigDos is not loaded.

Latest mint versions support fat/fat32 and big partitions in native,
this means bigdos is now useless under mint, and will probably
interfere with it.
But you must edit your mint.cnf concerning this.
Bye bye Stichting.

1391. help with nfsd on mintnet

Newsgroup: comp.sys.atari.st
Date: 1999-01-21 00:00:00 UTC
From: dorian@lemaryol.frmug.org
Message-ID: <wgcid2g324$h151$i49$j9702da9f@lemaryol.frmug.org>
Source record: 85809

Hi All,

Anyone using any of the nfs server available for mintnet (0.70, 0.74,
rpc.nfsd) with success? I can't get any to work. Linux on one side,
f-mint-1.15/mintnet-1.03 (based on kgmd) on the other, through a ppp
connection via null modem.
I tried unsuccessfully different things in the exports and hosts.*
files. With 0.70 and 0.74, i always get a 'could not do nfs_mount' when
trying to mount, even a local dir. With the last rpc.nfsd release, the
rc bootprocess will just hang after some RPC
errors on both nfsd
(linked to /sbin/rpc.nfsd) and mountd (linked to /sbin/rpc.mountd)
loading. Both are uncommented in inetd.conf.
No problems for accessing remote nfs though, only on the server side.
Any ideas?
Sorry for the probably uncorect terminology i used. Bye bye All.

Here's one for you.

I've recently become addicted to Pokemon on my Gameboy. I got my mom to get a copy for my son for Xmas. It really didn't sound like that appealing a game when it was first described to me but last weekend I was playing my son's game and found myself hooked to it. He had the Blue version, so I ran out the next day and bought the Red version. I'd absolutely love to see a game like this on the ST (with colour AND mono support would be best).

Some features that I think might make an ST version of this game even better than the gameboy version (apart from the superior graphics available on the ST) would be to emulate the "gamelink" feature through the modem as well as putting in MIDI support so you could have 16 STs all hooked up for major Pokemon battle/trading sessions.

And with the greater resources of a 1040ST you could have many more types of Pokemon, a bigger story, and a much larger world than the gameboy can deliver.

Just thought I'd throw this out there incase there are still a few ST game programmers kicking around wondering what to do next.

Anyone else care to throw out some game ideas they'd like to see done on the ST?

Off hand, I can remember these: Two-in-One, CoNnect.

I hope it helps. ,-)

Additionally, you might want to consider software that used to
cost something to upgrade, but nowadays can be easily updated
by downloading the latest from the net (if you're already on the
registered user list, using a legit package): ImageCopy.

Yup, but big and slow by all accounts.

> > > but I'd have thought style sheets were a possibility for anyone with
NVDI
> > > or GDOS installed.
>
> It's not a question of NVDI.

True, but it's a question of font handling and positioning on screen for
the most part, which CAB already does. It just needs to understand CSS way
of telling it to use green Times Roman 14 pt (for example) at a particular
point. It's already doing half the job displaying text via GDOS/NVDI using
vector fonts (hence the reference to GDOS/NVDI in the first place).

> Basically, Java/Javascipt requires a text parser that is completely
> different from the HTML parser. Two different ones, in fact.
>
> There is also the question of RAM capacity and CPU speed to handle
> these 2 extra parsers. The ST is already left in the dust, when it
> comes to that. TT or Falcon could manage, but just barely.

Hence Java/Javascript being a different matter. CSS doesn't seem to be
anything like as complicated, but what do I know? It's academic anyway if
CAB's author isn't planning to do it.

>simple pin-to-pin jobbie.
>

A word of warning, though. I did a similar thing myself, but to
connect a box with SCSI controller+IBM DSAS 3540 disk to my Mega.
I found a nice-looking 18-leads shielded cable, soldered the connectors
(there are multiple grounds on the connector, so one wire less should not
matter, if the pins are connected at the connector ?), soldered
the shield to one of the DB19 casings, checked and re-checked everyting and...

and found out that the connection would not work reliably. I rechecked
the connections and everything was ok, yet sometimes the disk driver
reported read or write errors. Without much further research, I
attributed the whole problem to non-compatible characteristic impedance
of the cable. A friend who is an electronics engineer told me that
this might indeed be the case. I dumped the cable and replaced it
with a 19-leads strip of flat cable. It works perfectly.

Some time later, I heard warnings that similar errors might be
experienced if the cable shield was grounded at both ends of the cable,
making unwanted loops.

So, not every cable might be suitable.

Cu.

04? There is no marker type 0x04 in any variant of JPEG I've heard of.
My bet is you've got a garden-variety data corruption problem. Check
where the file came from and how it got transferred --- some sort of
text-format conversion process mistakenly applied to a binary image
file is the most likely explanation.

Hi Tom,

sounds pretty much what I figured... since Jpegtran and djpeg.ttp from the
6 package both complained about them...
They were (IIRC) UU-encoded files from one of the binaries groups. I could
load them into 1stGuide OK. One of them had corrupt data at the end and
that was the one which wouldn't convert at all in Jpegtran/djpeg.ttp.
Ended up with 0 bytes. Usually the types won't load in Graftool, next I
rework them with Jpegtran and they're OK.

To my knowledge they sell the German version of HDDRIVER, i. e. with
German manual. You should check this if you don't speak German before
buying. The latest version of HDDRIVER with an English manual is
available from System Solutions. They are always up to date with their
version because they get each new version immediately by e-mail.

1407. Programs that are now Freeware?

Newsgroup: comp.sys.atari.st
Date: 1999-01-21 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <19990121085238.27974.00000531@ng93.aol.com>
Source record: 85875

Hello

As I said in earlier messages, I've been away from the Atari scene for around 6mos and have lost touch with a number of things that I'm trying to catch up on.

One of the area's I'm looking at are programs that used to be commercial or Shareware that now might be freeware. Does anyone have a list of programs that, say, within the last 6mos or so, have become freeware? Is there perhaps a list somewhere (or FAQ; perhaps on a web site) that would list such programs?

As examples, I heard that the telecomm program "Connect" is now freeware; is this so? What about Freeze Dried Term? I know that ST Format put a "key" on one of their Disks of the Month that opened all the options on FDT, so is it now freeware? I've had a couple requests for the program "Atari Planetarium" that I know I have an original copy (or two) of boxed away (but haven't had a chance to dig out yet) in my inventory . Is this program still considered commercial?

I know that it might be impossible to list every program that is now freeware but if someone could provide some "popular" or "well known" program titles that used to be commercial or shareware that are now freeware, it might help a lot of people determine if they might be pirating a program if they give a copy to a friend.

Despite The Computer Dungeon being closed, I still get quite a few phone calls or Emails from people wanting to know if I have a particular program or not and I'm really not sure what to give out and what not.

NOTE: I am NOT trying to start up the "copying old commercial programs is piracy" Vs. "they are no longer made so it ain't piracy" debate. I'm just looking for a list of formerly commercial/Shareware titles that can now be freely distributed.

Thanks in advance for any titles, ideas, suggestions, etc. that you might contribute.

Al Horton

Very strange - but at least I know not to spend too much time tracking down
a non existant problem with my setup. Although Louis reports that it works
fine for him - looks like it's another one of "those things"...

>With MiNT ofcourse aFTP works smoothly. I can upload for instance 100

actually, according to CTV News, the story is that the Chinese
government is requiring all the senior officials to be on that jet on
Dec. 31st as an incentive to get their act together to insure that
they'll be Y2K compliant.

The only couple of programs I know of that have gone freeware are:

-STOS Basic
-Two in One

-Connect
-RoboBop + other stuff from the same author
-Backwards 3.01
-SToop

Most of these are on the UTSI pages.

http://www.multimania.com/falkweb/UTSI/INDEX.HTM

Maybe it's time to start a list.

Strange. I've used the STiNG version of aFTP for a while now and I've
never had it crash, not with downloading, uploading, browsing through
sites or anything. Perhaps it is conflicting with something in your
setup?

1415. REQ:Looking for Deskicon.rsc Editor for Falcon With Monochrome Monitor.

Newsgroup: comp.sys.atari.st
Date: 1999-01-21 00:00:00 UTC
From: esc <escaisey@hotmai.com>
Message-ID: <787n60$onp@netaxs.com>
Source record: 85883

Does anyone know of a Deskicon.Rsc file editor for a Falcon
with a monochrome monitor.?Also an Icon editor that can read
*.ICO files.

It can be either a Shareware or Commercial software program.

I have downloaded ICDRAW1.42 but this only works with color
monitors.

I have some *.ICO files that would like to add to my Deskicon.rsc
file.What can I use to do this that runs in monochrome.

I do not use any replacement desktops,as I mainly use computer to
run Cubase Audio Falcon and sometimes Logic.

Thanks for any assistance that you can give!

For all those who has troubles with aFTP, try the latest version. The
friend of mine who reported his uploading problems just told me that with
the latest version all his troubles are gone.

As usual you can find the latest version at the Belgian ftp-site

193.190.205.13 atari/incoming/internet/amail/aftp15b.lzh (MiNTnet version)
/aftp15b.zip (STing version)

Actually, I can upload fine... that's to my own webpage. The only problem
I have is after the upload I don't get the directory displayed again...
This happened with Newsie as well, so I gather it's not the FTP-program's
problem but one on my ISP. It also means that in case I need to renew 5
files, I have to connect and disconnect 5 times (never tried it by sending
5 files in one go with both programs...)

Talking about one of those things: you remember probably that I was a
fervent user of MagiC: it never crashed. Since I've been fiddling around
with Mint/Mintnet plus the use of XBoot again, there have been small
changes in my autofolder, some programs run in different order than
before: MagiC has become more instable than before now! I really gotta
sort out what was the perfect running order for MagiC to be "rocksolid"
again... I noticed that sometimes a PRG is renamed PRX and at the same
time the physical place in the autofolder changes as well... Someone able
to explain this????

I believe if you have the source directory (opened) in unsorted mode,
they'll be copied as-is.

Also, COPS sorts your CPXes in alphabetical order, if you're into
that. (I prefer them that way.)

Check price at http://www.emulators.com .
Gemulator is still the best Atari emulator for PC, and it is worth pay for
it.
And it is fastest. On my K6 350MHz, it runs 15-20 times faster than Atari ST
!

Ha! You will have still only 2.5 MB RAM in 1040, since Atari ST can
handle only 2 banks.
And it is not so simple put RAM in machine, which does not have connectors
for it....

> to explain this????

It's probably something to do with how directory entries are used/re-used,
but that's out of my league...

However, you can dictate the order of AUTO programs much more easily in
MagiC by using an AUTOEXEC.BAT file. This is just a text file list of the
programs you want to run in the order you want to run them, one program per
line, eg:

```
; You can include comments using semicolons
NVDI.PRG
MAGCUFSL.PRG
DRVIN.PRG
MFP.PRG
STING.PRG
```

I believe that they introduced this as a way of dealing with the problem
when running MagiC on other hardware, eg MagiCMac and MagiC-PC, as you
can't sort the directory structures easily if at all on those machines.
However you can use it in the Atari versions of MagiC, judging by a
discussion in here a while ago.

If MagiC finds this file in the AUTO folder, it uses it and executes the
listed programs (ignoring any others) in the order of listing. Should make
it easier to experiment!

Thanks Nick

Making such a set of short cuts was just what I was trying to do.
Must have missed something, but whatever I do W95 tells me it cant
find file. I have the following in the command line:

C:\ATARI\PCST048\PACIFIST.EXE/ ini winter.ini

The file winter.ini is in the same folder as PACIFIST.EXE.

I have tried putting in quotes at various points, without success.
I have tried removing .ini. Tried putting file name in capitals.
W95 still stubborn. (never had this trouble with VMS).

[Just before sending----- got something nearly going by editing some
space separtors, but I go a virus testing box coming up which said no
virus in memory and the froze screen with the scroll lock lamp
flashing!]

maybe nearly there?!?
thanks
Lewis

> Just trying to understand this bird!

Falcon has more video modes than any previous Atari, basically
it is 320x200, 640x200, 640x400 in 2/4/16/256/65536 colours on RGB
(with some restrictions like 320x200/2 colours is not possible)
and 320x240, 640x240, 640x480 in 2/4/16/256/65536 colours on VGA
(different restriction: 65536 colours is not possible if the display
has >= 640 pixels horizontally). RGB modes can be overscanned
(i.e. you get 768x480 instead of 640x400).

On VGA, the Falcon "ST-high" + 16 colours is exactly the same as
TT medium.

> 3. When I attach my NEC Multi sync to the Falcon, I get the full screen, while on my
> TT...I get 2 inches of margin on each side. Is this because of the
> falcons extra video displays? It sure would be nice to have all this
> territory on my TT!

The actual screen dimensions (in pixels) are the same, just TT
generates display smaller (in centimeters) due to different timings.
Falcon has proper sync for standard SVGA monitors, TT does not.

>
> I just picked up a Megafile 30 and a STand including 2 external floppy
> drives for the grand total of $5 from the local Goodwill. Can anybody tell
> me where I can pick up a cable to connect it to my ST ?

The simplest "fix" is to buy a regular 25-pin to 25-pin straight-through cable (used in the PC world for switch boxes, etc.) that includes ALL the wires (*DON'T* buy a modem cable by mistake!) and snip out the pins you don't need (you may have to clip off part of the metal cowling/shielding on one side). Make sure you check your pins *BEFORE* you start clipping! The cable should be fairly short (maximum of 2 feet, but shorter if you can manage).

It might not look too elegant but it works!

Hope this helps,
Randy Kwak

Jo asked :

>I have some PCB-layouts in HPGL-format that I need to convert to bitmaps.
>Does anybody know of a GEM-program that can import these files?

There are probably quit a handfull of solutions, but one of the simplest and best I can think of is Calamus. You can import a HPGL and then export it via the Bridge module export as a bitmap.....-)

If you don't have Calamus & Bridge email the pics to me and I'll convert them to the bitmap format you like.

Cheers from Belgium

Of course, that means that no problems occured since then
on *my* setup.

> lots of problems with long filenames and
> doesn't understand quoting, which cripples it seriously on my setup
> (MinixFS and VFAT everywhere).

That's not my setup, so it's your option to encourage me for
that kind of support. I *have* solved some problems with long
filenames in recent updates on user requests, but I know it's
not perfect. However, I can't spend much efforts on this subject
without user support.
Working on the JPEG handling is another thing, for example, since
this contributes to the important IJG development.

Regards,
Guido

1432. Atari OS Software for falcon

Yes, pppkit worked for a happy few. Some friends and I have tried to
install pppkit but alas never succeeded in our purpose.
My first MiNTnet (and also my first Internet contacts) experience was with
the TAF package which was pretty easy to set up. I've used it for years.
Recently I switched over to KGMD which ask some extra care to install but
IMHO it's reasonable easy to install.

I'm happy that I can do something for the Atari-community. Strictly speaking, I'm not the maintainer. I just do the uploads. The maintainer was a student at the RMA. He's graduated now and isn't releated to RMA anymore. I'm on my own now. Before he left the RMA he has had a serious talk with the headmaster and received that that site will be online for quite some time.

That's not completely true. I use jpegtran all the time to 'fix'
corrupted JPEGs (usually premature EOF), and it works 90-95% of the
time. So I guess it depends on what it finds wrong.

Scooter PCB's plotter program can handle HPGL (well it saves it and can
pull it up for later plotting anyway) and Scooter can also output .IMG, so
I expect theres's someway fo doing it ....if you've got the gerber then the
people who make Scooter will convert to a Scooter .PLT file and you could
print from there.....

JAT...

Scooter PCB kicks arse on the Atari platform for PCB design.....

Source record: 85760

Hi,

Martin just warned me the dutch RSC files for Thing 1.27 on my page
appeared to be corrupt. Checked it myself and indeed. The file must have
gone corrupt after I unpacked it and used it myself on Thing 1.27.

Anyway, just went to Godfried's site and picked it up again, strangely
enough the file went up from 34268 bytes to 48500 bytes and it has been
transfered to my page again.

If anyone experiences troubles again with it, just let me know.

Filename is still the same, THIN127N.ZIP. The index file hasn't been
upgraded yet, so still states the old filesize :-) Gimme some time, pls

1443. First Word to MS Word 97 document conversion

Newsgroup: comp.sys.atari.st
Date: 1999-01-22 00:00:00 UTC
From: Roy Stead <hagbard@connectfree.co.uk>
Message-ID: <78arf6$71s$1@news1.cableinet.co.uk>
Source record: 85761

I've managed to transfer all of my FW+ documents over to this PC's hard drive, but I'm finding it impossible to convert them to a format - any format - which MS Word 97 can read (other than saving them as plain ASCII, but I want to preserve the formatting, especially italics/bold/superscript/etc).

So - I'm guessing this might be the place to ask - does anybody know of a utility which can convert the files for me? (There are hundreds of docs, so manual conversion isn't practical)

I've got PacifiST and WinSTon running on the PC, so a util which runs "on the ST" (under one of them) would be okay - I wouldn't even mind an n-step batch process, since it only has to be done once...

Since I'm not a regular reader of this newsgroup, I'd appreciate any replies by e-mail to this address.

Thanks in advance, and if - by some chance - this wasn't the right place to ask then please accept my apologies, and I'd appreciate being pointed in the right direction.

All the best,
Roy

>have problems
>cab 1.5 can t open urls(to long i think), newsie 90 can t open problems
>with rsc file.Connection
>with sting is ok.

I am using 520ST with 2.5 meg of Ram and TOS 1.0.
I set it up back in Nov last year, upgraded software along the way.
I used NEWsie up to .86 I think, Use CAB 1.5, and STing 1.08.
I also used overlays up to 1.2** then ran into some trouble and ran out of time
sorting out what it was. I think it was the first version with cfg file or I
never used a cfg for the overlay before.

Anyways, I ran into the URL problem but haven't had (TIME)to study my error. (It is
usually me 99.9%. However I sort these things out myself and with help of everyone
else here.

Here is what I can tell you about TOS 1.0 . It can connect to internet.
You have proven that too. Use an OLDER overlay for CAB. 1.205 or so.
Use an older version of NEWsie. .84 or so.

Get these working and then update each piece individually.
CAB CACHE works and can edit the cache but bombs on exit. So let it be the
last thing you do, although sometimes the crash to the desktop is recoverable
with TOS 1.0.

Unfortuneately (FORTUNEATELY), I sometimes can't (DON'T) touch my computer
for months. This is why I can't answer you about newer updates, as I like to
test fully before condemning, TOS or version or software.

Weve been extremely lucky.

Let my brain catch up to where I was a year ago. (See I am using older NEWsie
at the moment) then update and we can succeed together.

>
>Is it possible to upgrade tos 1.02 to 1.04 with software ??? So yes were can

TOS upgrade certainly is a better solution. I believe even MAGIC could cure
the problem. I have Version 4.0 but haven't installed it yet.
Yes I know its old too. I am so slow it is also completely unopened:-).

h> another and end up with the same order I'll be happy...
If not using Kobold (and with at least TOS 2.x or higher), just turn on
the
"No sort"/"Ingen sortering" at your desktop, select the files and copy.
;-)

Hmm. 1stGuide uses the same IJG decoder that's in jpegtran and djpeg.

> One of them had corrupt data at the end and
> that was the one which wouldn't convert at all in Jpegtran/djpeg.ttp.
> Ended up with 0 bytes.

One of jpegtran's less pleasant properties is that it always reads the
whole source file into memory before it writes out anything. Aside
from hogging memory & swap space, this means that if there's anything
wrong at the end of the file, jpegtran will complain and quit without
writing anything. Feed the same bogus file to djpeg, and it may be
able to write much or even all of the output file before it hits the
bad spot and complains. (PPM output mode works well for this, since
djpeg will write PPM output line-by-line.)

It might be that 1stGuide is simply ignoring the error that the IJG
decoder is reporting...

AFAIK, the demo only lets you access the MagiC Mac folder that is on
your Mac hard disk after running the install application. You will
need the full version to read Atari compatible formatted zips, EZ's
and hard disk.

There are ways to write to a DOS compatible drives on an Atari
which your Mac can read without the need for MagiC Mac, unless they
area Atari (TOS) applications. Then your stuck with using a floppy with
the demo.

1460. X-control and Falcon

Newsgroup: comp.sys.atari.st
Date: 1999-01-22 00:00:00 UTC
From: tconrardy@hotmail.com
Message-ID: <7897bussk1@news.ncal.verio.com>
Source record: 85822

Hello All:

I am helping out a friend to configure his "new" falcon. My experience
is with a TT030 and a Mega STe. The Falcon is a different (but
beuatiful) Bird. So I have some Q's I am hoping you guys can help me
with:

1. Whenever I set the screen colors in X-control, save the default,
then save the desktop/ and save Configuration (in Neodesk), the colors
are NOT saved after I reboot! I am trying to save as Reverse-Video,
but after boot up, it is "regular" with the same colors as before.
Any Suggs?

2.It looks like there are several video "modes". Is this the scheme?
ST low/st med/ st Hi with 3 video modes each? (4/16/256 colors)
When I go to ST HI, then switch to 16 colors, it looks like TT med res.
Just trying to understand this bird!

3. When I attach my NEC Multi sync to the Falcon, I get the full screen, while on my
TT...I get 2 inches of margin on each side. Is this because of the
falcons extra video displays? It sure would be nice to have all this
territory on my TT!

Well....thats it for now...any suggs would be helpfull!

Thanx

hate to say this BUT..I believe PRO 24 is a Dongle program, much
like Cubase. So even if you had the disc, you still need the
Dongle...OH WELL...deep subject.

There is a program that was 24,s little brother called
"12" which is very similear to pro 24..but only 12 tracks.

B&C Computer visions has it for only $10.00 I believe.

As far as the Spectre GCR goes, it' is usally considered as equivalent
to a Mac Plus, therefore you might want to search for some classic mac
web pages. There are some around, and there are some die-hard 512K Mac
users out there that will probably be more knowledgeable on System 6
resource that most people on here.

> taken over here.

I must agree with you here. In your original message you stated that you
already had 3 machines. I see no reason to buy another one. You must
use each machine for what it does best. As I suggested:
- Connect the STFM to the TV for games
- Setup the Mega 2 for your OS exploration
- If possible, put the 520's RAM board into the STF for music
- If not, then just use the Mega for music too, and keep the STF as a
backup machine.

> If you just want to tell me how much better your TT/Falcon/Milan/MagiCPC setup
> is than my STs, I guess that's spiffy for you. But it's not exactly the help I
> was looking for.

I think you misuderstood his comment. It's true that a faster machine is
much more pleasant to use, and in most cases, cheaper than upgrading a
520STF for example. However, in your case what you have is certainly
enough.

> Tell me more about "tight." What can you do in 4Mb that you can't do in
> 2.5Mb, or in 2.5Mb that breaks in 1Mb?

Well, the main point of a modern OS is multitasking, and since virtual
memory is impossible on an ST, then you only end up with enough room for
one program.

For example, MiNT is small. But if you want to multitask you have to run
another AES (AES4.1 or N.AES), plus some extra stuff (network
extensions, NVDI, a better desktop...). All this will easily end up
taking 1 or 2 Mbs. On a 2.5Mb machine, you'll be left with just enough
RAM to run one major app. On my 4Mb falcon I'm left with approx 1.5Mb
once everything is loaded.

MagiC might be better on this standpoint, I don't know.

>
> Is there a net resource that compares OSes on different memory size machines?

Not that I know of.

> I've also got a MultiTOS disk, I don't see many references to that (did it
> become N.AES?).

MultiTos is actually and old version of MiNT + AES4.1 (I think) from
Atari.

That should be right. Try again with another disk.st file or another tos
image. It sounds like the .ST file is incompatible with the TOS image
you're using. Some games just won't go anyway, whatever you do.

> compatible with the ST software ? What about compatibility with the monitors
> and disk drives ?
>

Compatibility is not a black or white thing. All Atari 16/32 bit
machines are compatible to some extent, but they all have there own
specific hardware and software.

This means that most of your ST software will probably work on newer
hardware, but some will not. Most games will have trouble running on a
TT or Falcon, but most GEM software will run perfectly well. It's
difficult to be more specific since you didn't give any example of the
software you're using.

An STE or Mega ST/STE are exactly like an ST as far as the monitor, the
video modes or external disk drive go.

Both the TT and Falcon can run with the ST Monitor. A mono monitor will
only display 640x400, whatever you connect to it. The colour monitor can
do 320x200 or 640x200 only with whatever colour depths are available on
the newer machine.

The Falcon needs an adapter to run on any kind of monitor, and can run
in interlaced mode on an Atari colour monitor but is best on a VGA.

The TT has a disk drive port, but the Falcon hasn't. You don't really
need one with these machines when you have hard drive anyway.

Hmm, well, actually it is based on it, with several adaptions.

> It might be that 1stGuide is simply ignoring the error that the IJG
> decoder is reporting...

One of the recent adaptions was to ignore errors in the marker handling
after decoding some data, especially at the end. But this was only a
matter of the surrounding application code, not the IJG library itself.
I noticed that even Netscape Navigator displayed the partially corrupted
file, due to smart error handling code.

Improving the behaviour for corrupted or truncated files was a major
concern for me while working on the JPEG handling in 1stGuide (see the
changes section in the README file). Recent IJG releases come close
to that feature ;-).

So you're still supporting 1stGuide? It has (or atleast *had*, it's atleast
six months since I downloaded it) lots of problems with long filenames and
doesn't understand quoting, which cripples it seriously on my setup (MinixFS
and VFAT everywhere).

> MagiC might be better on this standpoint, I don't know.

You'll save about 300-500Kb with a plain MagiC-installation, mainly because MagiCdesk is so compact (and rather limited compared to Thing and Jinnee). With MiNT/N.AES you don't have a choice since N.AES doesn't have a built-in, compact desktop. Ofcourse, you can load/unload Thing whenever you want, but this isn't very practical, and will most likely cause memory-fragmentation and make things worse.

But let's not forget the third option - Geneva. IMHO this is by far the best choice for the smallest machines, simply because it's comprehensive, very compatible, compact and fast. And you can revert back to the desktop, do whatever you want and restart Geneva again without having to reboot.

Geneva doesn't have a built-in desktop either, but it has tools that makes it very usable even without one (in fact I used Geneva 004 demo without a desktop on my Falcon for almost six months...). And IIRC the latest version of Teradesk works OK under Geneva. NVDI (minimal installation), Geneva and Teradesk should leave atleast 1.5Mb free on a 2.5Mb machine, more than enough to do useful things IMO.

> > I've also got a MultiTOS disk, I don't see many references to that (did it
> > become N.AES?).

See 'http://www-atari.nvg.ntnu.no/n.aes/' for more info on N.AES.

> MultiTos is actually and old version of MiNT + AES4.1 (I think) from
> Atari.

AES 4.0. 4.1 was never officially released, but you can find a beta on most ftp-sites (and in KEMD, look at http://users.leading.net/~kellis/). It's a huge improvement from the official MultiTOS, a lot faster and more stable.

1477. Ataricentral.com/Atari.net progress update

Newsgroup: comp.sys.atari.st
Date: 1999-01-22 00:00:00 UTC
From: webmaster@multimedia1.com
Message-ID: <78a0d0$pt7$1@nnrp1.dejanews.com>
Source record: 85839

For those of you who used to frequent these sites under the ownership of Toad computers and want to know when they'll be back, here's the scoop. We're just about ready to go back online...but the transfer of domain ownership through InterNIC has been rather sluggish to say the least... They seem to be really bogged down. It's mostly up to them at this point.

Also... I had posted about our plans for these sites... which have changed just a bit. Ataricentral will retain the message forums for general Atari messages (including ST, Falcon, GEM, etc.), as well as Jaguar, and maybe add more based on the interest level and suggestions of visitors. It will not be commercialized in the sense that Atari products will be sold directly through the site... but we will provide references to Atari resources, including a strictly Atari search engine and some advertising on the main section pages (no commercial advertising will infect the message posts themselves). There will be some other nice surprises as well.

We also have some interesting ideas for Atari.net... but that will become a seperate site to go online some time after Ataricentral does.

Anyway... that's the latest. We will post an announcement when the site is officially back up. Hope you all stop by and get reacquainted :)

1478. FS (USA): Multisync monitor - $55 + actual shipping

Newsgroup: comp.sys.atari.st
Date: 1999-01-22 00:00:00 UTC
From: lmcclure@aristotle.net
Message-ID: <MPG.11122fe0f02b67a5989687@news.aristotle.net>
Source record: 85840

I have for sale an AT&T 329-M multisync for $55 + shipping.

This monitor is apparently a rebadged NEC Multisync II (looks the same outside, and uses the same components inside). Great for ST's or a Falcon where you need access to both 15.75Khz and VGA scan rate modes on the same monitor.

For more information and pictures of the monitor, visit:
http://members.delphi.com/lmcclure/sale/index.html

I have the following software up for sale. As I don't really know the going rate, make an offer for anything you're interested in, and I'll get back to you.

Games:

Microprose Formula 1 Grand Prix
Super Grid Runner
Pipe Mania
Skweek
Trivial Pursuit: A New Beginning
Rick Dangerous
Conflict
Kick Off & Extra Time
Leaderboard
Populous
Populous II (1Mb)
Utopia & Utopia: New Worlds (Double Pack)
Steel Empire
9 Lives
Stunt Car Racer
Cannon Fodder
Virtual Reality Vol. 1 (Compilation: Starglider 2,
Carrier Command,
Midwinter,
International Soccer Challenge, Stunt Car Racer)
Action Service (No Box)
Championship Water-Ski Challenge (No Box)
Final Fight (No box / instructions)
Konix/Codemasters Compilation: Mig 29,
Treasure Island Dizzy,
Pro Tennis,
BMX Simulator
Operation Stealth (No Box)
Powerdrome (No Box)

Applications:

Canvas (Art Package)
GFA Basic 2 (BASIC Interpreter and Compiler)
Diamond Back II (Backup tool)
Lattice C 5.52

Thanks.

I have Notator SL version 3.21 from Emagic with the dongle, disk, and the manual part 2. Unfortunately, however, I've lost manual part 1 which is basically the manual for Creator. Does anyone have an extra copy of this by any chance they'd be willing to sell? Or does anyone know where I can still obtain an extra copy ? I've already tried emailing Emagic but they didn't even reply me back. I am not sure if they support Notator any longer. Any help will be very appreciated.

Hmm, I've had some success today - it looks like it's dependant upon which ISP I call. I'd been trying to upload to the "other" site, this had failed despite the right passwords etc - there's more to this than meets the eye.

Any hints or tips please?

Is there anything that I've overlooked in the configs, what of this "passive mode" and is it the same as the PASV command that I've seen in the log file?

>As usual you can find the latest version at the Belgian ftp-site

Thanks for taking the time to keep all this going Martin! :-))

I still use an old but real Atari ST. I use it a lot for MIDI
software. Can I use MIDI software on a PC with Gemulator? I don't mean
heavy stuff like Cubase Audio or Logic. If I ever switch to PC/Windows
I will probably get a native PC version of one of these programs.
But I would like to use smaller programs like synth editors. If
possible. Is MIDI supported?

1488. Tower power supply ...

Newsgroup: comp.sys.atari.st
Date: 1999-01-23 00:00:00 UTC
From: dipching@ping.be
Message-ID: <36a9ed4e4299c3@ping.be>
Source record: 85700

I know this is not the right place to ask such a technical question
but, no luck I can nomore get access to st.tech group ...

I'm puting a TT inside a tower for a friend and we have the bad
surprise to see that new power supply models contained inside tower
kits do now use a double rows 12 pins connector rather than the old double
6 pins connector which was just a matter of carefully inserting it in the
place of the genuine TT power supply (which is 12 pins in 1 row ...)

After having mesured each wire a technician came to the conclusion
that it was possible to find the "old" corresponding wires to feed the
TT ... so we made it and the TT refuses to start ....
Of course with its genuine power supply it works perfectly ...

Does anyone have any idea if the voltage outputs are always compatible
with previous PC power supply units ? (excepting they did add the
new 3.3 volts ...) ????

Or perhaps will we have to find one "old" model ...

Thanks for any answer here or by email

Your PC software won't run on an ST, but files are interchangeable in many cases. What you want to do is download Atari software onto you PC then copy the files to disk and stick in your ST.

Have fun.

Derryck,

maybe, just maybe. This problem exists since I hooked up to Demon. Before
I used Newsie for FTP-ing, now aFTP. After one file has been sent, the dir
won't come in again. It just hangs there.

It's not that difficult: send a file, wait till the transfer has stopped,
kick out aFTP using the "kill" option, start up again and connect again.
OK, you're losing some time, but not for a complete hookup. Have to try it
with more files in one go; which wasn't possible using Newsie.

Actually, I've written it down somewhere too. Gotta take a look. But since

the last Mintversion was installed, the running order changed slightly (I can notice from my boot-sequence) and somewhere this causes MagiC to hang for no reason at all at times. It used to be ROCKSOLID!

Sounds like a ATX-case. AT-cases/PSUs are more suitable for
convertions, but are harder to find nowadays.

> After having mesured each wire a technician came to the conclusion

ATX-powersupplies can be software-controlled (automatic power-off in
Win98), and I believe that you must connect one or two of it's pins to
either ground or +5v to get it to work with non-ATX motherboards. I
don't have any detailed information here, but a quick search on Alta
Vista should do it.

The easiest solution is probably to swap the ATX-powersupply for a
normal AT-PSU.

>540HD is this possible and can anyone help me?

Falcon OS is a ROM Chip. Releases from 4.01 -> 4.04 (latest)
Why do you need the OS?

Falcon contain a IDE Harddrive
You can replace the old smal device with other IDE devices
from xx up to xx *GB*

Same interface, same device driver.
TOS handle partitions with the bigest size of 1Gb.
(That's - N O T - the device size!!!)

If you take a 8Gb device you got 8 partitions, 1GB each.., as example

Enough space for ye a r s ....
(Same with 2.1Gb devices, 540MB device..)

Selling my 2.5" 540Meg device for 140 DM (without p&p)
(I replace it with new toshiba 2.1 Gb MAT for ~300 DM)

That's it, eh? I have an 8-bit and the process was much more complicated. I needed a conversion program, a compatable 5 1/4 drive on the PC end, and a little magic pixie dust. I never actually got it to work and ended up building a SIO2PC cable, but that's another story and shall be told in another newsgroup.

Yes, you showed me that but at that time my head wasn't very clear as
you'll remember. It was really a bad day (lost a whole partition with some
important things on it). Anyway instead of making a screendump you can use
some system info progs instead. For instance Shau'ri and Profile 2.22.

These programs creates a very neat list.

The homepages of these programs can be found in the UTSI pages (see my
sign off for the URL) Just follow utility/divers link

> but I want to preserve the formatting, especially
> italics/bold/superscript/etc).

Hi Roy,

There are a couple of ways you can go. First it is important what
version of FW+ your docs are from. If it's from before version 4 it's
the easiest; Then you can use the folowing programs:
First there is a utility called FW2RTF, which converts FW+ docs to MS
Word readable .RTF files.
You could also try (the demo of) Papyrus it loads FW+ documents, and
then you can export it as .RTF or Word doc.

If your FWdocs are from version 4 or 5, then you can export them from
Wordplus itself as .RTF

FW2RTF you can find on some FTP-sites. Unfortunatly I don't know
which ones.
Papyrus demo you find at: http://www.rom-logicware.com/demo.htm , But
I don't know if the PC-version also loads FirstWord+ docs.

Bye,
Karsten

>possible. Is MIDI supported?

MIDI is one of rare things, what are not supported in Gemulator. Reasons
are probably:
1: Missing MIDI connectors on PC-s.
2: Problems with timing in emulation

Maybe is better if you ask directly at emulators.com .
There is many MIDI software for PC, Cubase too, but programs are not
cheap.

Pera

1506. Can ICDTIME.PRG take y2k?

Roger, I agree 100 percent.

The problem is, most users/points don't pay their donations any longer.
"We" had around 100 registered points plus several "registered users" some
years ago, but that's "had", unfortunately.

The sysop told me he's gonna disconnect all the non-payers or points that
don't collect their stuff within a few weeks... lemme gather: probably
leaves maybe 10 people to continue with Bearboard. I myself removed the
whole pointsoftware from my HD, since I connect to Ton by means of
voicephone and email, no need for bbs-connections any longer. But it's a
shame that the biggest Atari bbs ever in Holland (and surroundings) has to
close down because of the "support" from it's own users :-((I should
restate that: the non-support from it's own users).

One of the side-effects from Internet, I'm sure...

1513. Re: Tower power supply ...

Newsgroup: comp.sys.atari.st
Date: 1999-01-23 00:00:00 UTC
From: robscha@data.rhein-main.de
Message-ID: <JAXSACBGUP@data.rhein-main.de>
Source record: 85725

In <36a9ed4e4299c3@ping.be> Jo Vandeweghe wrote:

>I know this is not the right place to ask such a technical question
>but, no luck I can nomore get access to st.tech group ...

Here is the right place. (But .tech sounds better) :)

>I'm puting a TT inside a tower for a friend and we have the bad
>surprise to see that new power supply models contained inside tower
>kits do now use a double rows 12 pins connector rather than the old double
>6 pins connector which was just a matter of carefully inserting it in the
>place of the genuine TT power supply (which is 12 pins in 1 row ...)

Sounds you found a tower case with latest ATX psu..
I have the pinout, but i'm not sure if this psu work well with you TT.
(Not tested)

>After having mesured each wire a technician came to the conclusion
>that it was possible to find the "old" corresponding wires to feed the
>TT ... so we made it and the TT refuses to start ....
>Of course with its genuine power supply it works perfectly ...

Following table shows the pinout of J100:

Pin Description

1 PG (PowerGood)
2 +5 Volt
3 +12 Volt
4 -12 Volt (seriell!)
5 GND
6 GND
7 GND
8 GND
9 -5 Volt
10 +5 Volt Mainboard
11 +5 Volt Mainboard
12 +5 Volt Mainboard

Pin 1 suggest you have to find the right PG pin of your new psu.

The PG pin hold down the psu for x mSeconds, the psu need this
time to make the output stable, if not, some hardware works not correct.

(Think you have the same problem)

If you have a ATX psu, take the right pinout out of DOIT-Archives
(It's a picture, no ascII text, sorry)

>Does anyone have any idea if the voltage outputs are always compatible
>with previous PC power supply units ? (excepting they did add the
>new 3.3 volts ...) ????

Do not connect the 3.3V pin anywere! TT and any other Atari Hardware, doasn't use 3.3V !)
Otherways, take another (older) psu out of an old pc.

Regards, Robert

In a nutshell, I am trying to update CAB OVL and NEWsie. My old setups work however now all my favorite sites seem to not allow me on. I cannot get to Milles WEB PAGE , it says forbidden? Has things changed this much in 6 months?

Anyways, upgrading NEWsie from .82 to .92 results in a lockup after selecting any menu. I only changed the prg and rsc files.

CAB I changed the ovl from 1.2704 to 1.2904. I have never used the cfg file before where does it go? Anyways, I put them both in the work path of CAB and the Module folder. Cab goes online and when receiving data, promptly crashes.

I was happy with 1.2704 however all the webpages seem to reject me now:-).

I have STing 1.08 and it is rock solid. I am trying to update one thing at a time. For the moment.

Signed 520ST TOS 1.0

Talk later.

Since Installing this newer version of the ovl in CAB 1.5 it bombs.
What is happening is it attempts to connect to the url then begins to download data, goes to drive A and crashes. With sting offline, CAB the new versions gives the (network offline message, very good feature:-), and goes to the cache on E:/ properly. With an older version of CAB ovl it also gets online properly and goes to the cache properly and no bombs?

Any ideas?

Brian.

1526. MultiSync switchbox

Newsgroup: comp.sys.atari.st
Date: 1999-01-23 00:00:00 UTC
From: tom.derrick@acpu.com
Message-ID: <917060073@acpu.com>
Source record: 85781

Hi, everybody. I completed my conversion of my Monitor Master into a 'Monitor Master Plus', a critter that will also act as a MultiSync switchbox. I uploaded the plans (text and pictures) to Applied Computing Internet Services, USA phone # 208 362-1790. If you would like me to email them to you for uploading elsewhere, email me back. The zip file size is about 23K.

It is a pretty easy project, but I suppose t hat I could make one of these for you, given a Monitor Master and a bit of cash for materials. I am going to check today whether the local ex-Atari dealer has any more Monitor Masters for this purpose.

1527. TT for sale

Newsgroup: comp.sys.atari.st
Date: 1999-01-23 00:00:00 UTC
From: Dan Phillips <xiting@worldnet.att.net>
Message-ID: <36A95DB9.4A33@worldnet.att.net>
Source record: 85782
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well, I've finally decided to give up the TT system. I also have a few
items I'm selling separately (prices don't include shipping, if you
don't like a price, feel free to make an offer):

Floptical and 5 21 meg discs (internal) $ 75

105 meg Quantum LP105S SCSI HD (internal) $ 35

Maxtor 40 meg SCSI HD (internal) $ 15

NEC 3Xe external CD-Rom drive $ 50

TT system: $500

TT030 10/16
48 MHz CaTTamaran
Nova ET4000 1 meg card w/ v2.08 drivers (fitted inside TT, up to
800X600X32K) 40 MHz FPU (Motorola never supported over 32 MHz
officially in PLCC, but my distributor got one from Motorola
that was tested to 40, which I needed to get the CaTT stable)
TOS 3.06
HD floppy
External Quantum 340 LPS drive

You can't put a hard drive in the TT case because the stock power
supply can't
handle the accelerator, RAM, Nova, and a hard drive. The back of
the case isn't perfect (the fan slots have been opened to a hole
to increase air flow and the video card mount is functional, but
not perfectly clean).

Calamus SL98, ExtenDOS, NVDI 4.11, and much more software would go
with the system.

1528. Re: New JPG standard?

Newsgroup: comp.sys.atari.st
Date: 1999-01-23 00:00:00 UTC
From: Tom Lane <tgl@netcom.com>
Message-ID: <uo9u2xieef8.fsf@netcom2.netcom.com>

> time. So I guess it depends on what it finds wrong.

That's true --- simple truncation of the input file is not treated as
a fatal error by the underlying IJG library, so jpegtran will cope with
that case. The question at hand, however, concerned a corrupted file
containg what appeared to be an undefined/illegal JPEG marker code.
The IJG library takes that condition *very* seriously, because it must
in order not to risk doing the wrong thing with future extensions of
the JPEG standard. (BTW "future" means "next year", not "might or
might not ever happen". See www.jpeg.org concerning JPEG-2000 plans.)

It's sheer bad luck that some broken netnews posting programs corrupt
the last few bytes of an image file in a way that looks like an
undefined JPEG marker :-(. This leaves decoder authors stuck between
a rock and a hard place. You can argue it either way, but I've made
my choice: the IJG code will not cater to broken software in a way
that compromises future extensions of the spec.

regards, tom lane

Just start the Dialer once (or install it as an accessory). Then the ovl
will "know" you're off line.

Bye,
/Pascal/

1531. FS: Winnipeg Atari ST User Group fundraiser blowout! MUST SELL!

Newsgroup: comp.sys.atari.st
Date: 1999-01-23 00:00:00 UTC
From: trevor@cyberspc.mb.ca
Message-ID: <6Ehq2.77$dm.23@typhoon.mbnet.mb.ca>
Source record: 85786

GIANT ATARI ST HARDWARE / SOFTWARE / MAGAZINE / BOOK BLOWOUT!

Yes, our sale is still happening! All prices knocked down another notch. Check it out!

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

Please look through our list and pick out something you can provide a good home to. All hardware/software is fully guarenteed for 2 weeks from receipt. Everything comes with full email tech support from a knowledgable STUG member, we'll try our best to help you out!

If you want a whole bunch of stuff, discounts are available. Let us know what you think is a fair price. We just want good homes for all this STuff!

Every item purchased includes an issue of the STUG Chronicles (our newsletter) FREE!

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly.

Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

Trevor Cordes - STUG President
trevor@cyberspc.mb.ca

==========
SOFTWARE / BOOKS
==========

Diamond Back II - great backup program to most any media $5 `
disk only

Degas Elite - brand new! original disk envelope is unopened! $12

Prism render tt030 disk only - v1.03 top notch rendering program $15,

Chronos keyframe animator tt030 v1.3 - disk only - amazing animator for TT $17,

Chronos keyframe animator v1.3 3disks - disk only - amazing animator $17,

Cyber studio set - hundreds of dollars of great CAD/paint/render software!
cyber paint v2.1, cyber mate v1.1, stereo cad-3d v2.02,
cad-3d, plotter & drivers, human design disk, cartoon design disk,
cyber control - disks only $23,

Space quest 3 hint book (book only) $3,

GFA Basic Manual - appears to cover v3.0 and 3.5 and compiler 3.0 $6
book only

Michtron gfa basic version unknown, 3 ring binder (book only) $3,

Michtron bbs v3.0 (book only) $2,

Macro Mouse by Antic disk only $5 `

Migraph drawing utilities set - includes TouchUp, MergeIt and Scan&Save
disks only, manual for mergeit $9 `

SwiftCalc ST by Timeworks - great spreadsheet with graphing 2disks
disk only $10 `

Word Writer ST by Timeworks - great graphical wordprocessor
disk only $3 `

Interlink ST - packaging/box only (no disk, no manual), beautfiul $3
black plastic videotape style box with the company logo all
over; slides into a white Interlink box

Windows Internet Tour Guide BOOK - 344p softcover, includes CD-ROM with $9 s
everything you need to get a PC on the net with Windows 3.x,
have an old 2/3/486 lying around? get it on the net the easy way!

==========
HARDWARE
==========

SyQuest EZ-Flyer 230MB SCSI external removable hard drive w/1 cart $89 h
Perfect for a Falcon or TT with a SCSI port or any other ST with an
ICD Link or other host adapter.
This is the great little 3.5" SyQuest disk system that holds 230MB
per cartridge. It can read and write the older 135MB cartridges also!
It is in a rugged and cool-looking external portable case. It is a
quick and cheap way to add a hard disk or unlimited removable storage
to any system.
It comes with the A/C adapter, SCSI cable (depending on what kind you
require, email for info), one 230MB cartridge disk and the drive
itself. Everything is in perfect working order and there are no bad
sectors on the cartridge. It is guarenteed to work for 2 weeks after
receipt. Includes FREE shipping in cont USA/Canada!!!!!

SyQuest 88MB cartridges only $34/each or 5 for $125 h

Printer support stand - 2 plastic legs designed to hold the printer $6 h
up over the paper which goes underneath. Works best with larger
dot matrix printers and continuous feed paper. Sturdy smokey-clear
plastic and rubber pads to support the printer.

Chinon CDS-435 SCSI CD-ROM drive 1X - was working fine but one $13 h
day stopped accepting disks (it just ejects them);
this drive has had the ROM upgrade to make it more compatible
with other computers

CapeTronic 1200 baud external modem w/builtin A/C adapter & vol control $12 h.
great starter modem for an ST or 8-bit; includes phone cable;
serial cable for ST/TT available for only 5 bucks more

Packard Bell 1200 baud external modem $11 h
great starter modem for an ST or 8-bit; includes phone cable
and A/C adapter; serial cable for ST/TT available for 5 bucks more

Atari 1200 baud external modem - classic modem $12 h.
great starter modem for an ST or 8-bit; includes phone cable
and A/C adapter; serial cable for ST/TT available for 5 bucks more

GVC 2400 baud external "super modem" with full manual $19 h-
great starter modem for an ST or 8-bit; includes phone cable
and A/C adapter; serial cable for ST/TT available for 5 bucks more

ZyXEL brand 16.8kbps and 14.4kbps external modem $39 h
best modem brand out there, super high quality, gives the best
speeds even on noisey phone lines, was $416 new, Zyxel brand
modems still are about 4 times as expensive as the "other"
brands, guarenteed to work perfectly with your Atari,
huge thick manual explains everything including how a modem
works! Includes A/C adaptor and modem cable of your choice
(25/25 for ST or 25/9 for TT/Falcon) and phone cable. Includes

email support from me for setup on Atari.

Supra brand 28.8kbps external modem with LCD display of speed,etc $44 h
great little modem! will work with any ST/TT/Falcon or PC/Mac
Includes A/C adaptor and modem cable of your choice
(25/25 for ST or 25/9 for TT/Falcon) and phone cable. Includes
email support from me for setup on Atari.

100 watt PMPO Power-Link PL-100 A/C powered 3D speakers w/3" cone $12 h
Plugs right into any Falcon/STe/TT (may need minijack to RCA converter
from RadioShack for a couple of bucks)

Pengo 25-pin data switchbox (2 to 1) for modems or printers $12 h.

5.25" floppy drive mech, stopped working recently, perhaps revivable $5 h`

Mouse pad by Moustrak Inc. - grey $3 h=

Modem/serial/printer cable 25 male to 25 male Dsub approx 5' $7 h

Original Atari mouse, guarenteed working $14 .

ST/IME internal clock/calendar from Zubair Interfaces Inc, sets your $20 .
clock automatically every time you boot. Includes box,
software and hardware. Suggested retail was $59.95. Brand new.
No guarentee on lithium battery (estimated 10 year lifespan)

Atari ST VT-100 emulator cartridge, weird antique cartridge from way $10 .
back when. For the hardware collector buff. Plug it in and
boot your ST and up pops a TOS-based terminal program!

Syquest 44MB removeable hard drive w/1 cartridge $74 .
in 2-bay (1 bay free) "shoe box" style external case including
host adapter so you can hook this drive directly up to any
ST without an expensive ICD Link. The case has a DMA thru
connector so you can still hookup your SLM or another drive.
Includes DMA cable and software. Everything you need to get going!

Syquest 44MB cartridge $29 each; 3 or more $20 each

Monitor Master, switch between color & mono with a flick of a button! $5 =

Golden Image optical mouse - no ball, super light, amazing mouse! $4 `
minorly broken, button sometimes works and sometimes doesn't,
and it often doesn't want to move right; comes with special
gridded mouse pad

Atari SC1224 RGB Color Monitor $36
docs =

Atari SC1224 RGB Color Monitor - minor problem: the power button switch $21
won't stay pushed in unless you hold it; fix or replace with a
switch from Radio Shack; otherwise works perfect with great picture
docs =

Spectre GCR - the premiere Macintosh emulator - complete and upgraded! $33 =
disk/docs/cable =

Epyx hand conformed joystick $3 =

3 1/2" Oceanic America Master-3S external floppy drive $37 =

3 1/2" external floppy drive - unbranded, sturdy slim metal case $31 -
with floppy cable and power supply

Atari 3 1/2" external floppy drive; flakey - reads ok sometimes $20 -
but most of the time doesn't; perhaps fixable; sold as-is
with a working power supply and floppy port cable

Epyx 500XJ joystick - minorly broken, probably fixable or usable for parts $2 `

Atari Mega STe computer 16Mhz 4MB RAM, 300MB+ hard drive $290
HUGE PRICE REDUCTION - was $415!
Now with both a working keyboard and a keyboard with a couple
of broken keys (for spare parts), and also now with 4MB instead of 2!
Great computer with BIG hard drive.

Atari 520 STf $22 .
no floppy disk drive; includes power supply; add 5 bucks for a mouse

Atari 520 STf $45 .
with DS disk external drive; add 5 bucks for a mouse

Atari 520 STfm $25 .
dead internal power supply (looks like it melted down);
probably repairable or certainly usable for parts; this is the
model with internal DSDD floppy drive and TV output

External Power Supply for the Atari 520 ST $20 .

Atari 1040 STf bare $70 .
add 5 bucks for a mouse, 1 buck for a manual, 1 buck for a power cord

Atari 1040 STf bare, needs repair: slight wobble in picture output $35 .
and internal floppy drive is dead, everything else appears fine;
fix or use for parts;
add 5 bucks for a mouse, 1 buck for a manual, 1 buck for a power cord

Atari 1040 STfm $78 .

Atari external floppy drive $28 .

Atari Color monitor $44 .

Atari Mono monitor $34 .

2 Wico hand-formed joysticks $3 -
1 in perfect condition; 1 sticks a little

"IBM Services" mouse mat; attractive plastic over foam base $5 h

1532. FS: SyQuest EZ-Flyer 230MB SCSI external removable hard drive REDUCED

Newsgroup: comp.sys.atari.st
Date: 1999-01-23 00:00:00 UTC
From: trevor@cyberspc.mb.ca
Message-ID: <lGhq2.86$dm.38@typhoon.mbnet.mb.ca>
Source record: 85787

Perfect for a Falcon or TT with a SCSI port or any other ST with an
ICD Link or other host adapter.

This is the great little 3.5" SyQuest disk system that holds 230MB
per cartridge. It can read and write the older 135MB cartridges also!
It is in a rugged and cool-looking external portable case. It is a quick
and cheap way to add a hard disk or unlimited removable storage to any
system.

It comes with the A/C adapter, SCSI cable (depending on what kind you
require, email for info), one 230MB cartridge disk and the drive itself.
Everything is in perfect working order and there are no bad sectors on
the cartridge. It is guarenteed to work for 2 weeks after receipt.

Only $89 including free shipping anywhere in cont USA and Canada!

Also forsale: spare cartridges for the 88 MB SyQuest drive:
Carts only $34/each or 5 for $125
All of them are geniune SyQuest brand.
NO bad sectors
(except 1 cart might have had 1 or 2 if I remember correctly)

Guarenteed to work as expected.

Also forsale: spare carts for 44 MB SyQuest drives
$29 each; 3 or more $20 each

Tom,

I've been experimenting with some of these JPG's again, and the
"unsupported marker" seems to be a variable one: one time the ttp sez
"00x4", another time it's being called "0x65" or something else...

Glad I've kept an old bunch of these ttp's from version 3.0A, they
sometimes seem to do a "better" job than the 6.0 version... Well, I tried
to convert a GIF to JPG with cjpeg yesterday and could only do with the
old version... (that was before the GIF-brand became a "paid-for" one :-)

so
> manual conversion isn't practical)

There is a utility called 1WP2RTF, which I found on one of the usual FTP
sites (probably Umich mirror at IC or Funet). It will convert the files to
RTF which is readable by Word etc. IIRC you can just pop the icon on your
desktop and drop files onto it (assuming you have a suitable desktop),
though I suspect you'd need to do one file at a time rather than dragging
several at once.

> I've got PacifiST and WinSTon running on the PC, so a util which runs "on
> the ST" (under one of them) would be okay - I wouldn't even mind an
n-step
> batch process, since it only has to be done once...

Not sure about emulator compatibility, but it's worth a try as it's a TTP,
I think.

BTW I have a page on my site about converting 1WP file sto PC formats at:

http://www.whalley.demon.co.uk/atari/texts/wp_help.html

....though in your case I doubt if it will tell you much you don't know.

Connect '95 now has the key generator included in its archive, the '97 Beta
is self-registering.

English docs for both versions and a completely translated RSC file for '95
are available on my www site, address is in my sig.

There's also a link to the main download site for the binaries themselves.

>resort to "AUTOsort" or similar programs?

Kobold allows you to copy and keep the same order - but I see that there are
other options. I've learnt something new today! :-))

>keep it like it is, but since I want to change the other partition sizes
>of the drive I guess I have to repartition everything again, even with
>HDDriver, or is it possible to leave one partition alone and repartition
>(and ofcourse erase) the rest?

All you can do is initialise a partition (ie clear it), but you won't be
able to change partition sizes AFAIK.

Hi Louis...you betcha, the 'Net has changed things for sure. At DarkForce, we used to get around 30 calls a day, on average, as little as 2 years ago, now we are lucky to get 5-10. (and I give stuff away!) ;-)

Still, I see the 'Net as one of the best things to have happened to Atari users, simply for unification. (this comes from someone who has invested lots of time/energy in a BBS too!) ;-)

The biggest problem for Sysops (IMHO) it finding a way to link our Atari based BBS's to the 'Net. There is no single "easy" way to do this, AFAIK. Yes-I'm told all the time to just put up a web page. Thats well and good, but what Web host will give me 4.5 gigs of HD space, and -10- CD-ROMs (3 Atari specific) online? Thats what the DarkForce! BBS supports. I'm still working/thinking/hoping to link my BBS up to the 'Net someday. Hope does spring eternal, as the saying goes... ;-)

>Any ideas out there?

You can't use the LS-120 with your Atari.
No parallel driver avaiable!

The only chance in the moment is a atari with IDE-Interface.
(Falcon, Milan) need HDDRiver 7.6 to work.

1546. rio portable mp3 player driver for atari?

Newsgroup: comp.sys.atari.st
Date: 1999-01-24 00:00:00 UTC
From: sunset
Message-ID: <78fjmg$afv@enews2.newsguy.com>
Source record: 85651

I'm frustrated by the fact that I can't play mp3s on my Atari mega ST. I've noticed for a while now though that there are these portable mp3 players on the market which can download mp3s from a pc parallel port and play them. There are drivers for linux that allow management of mp3s on these portable mp3 players. Would it be possible to write a driver for an old Atari ST to do the same using Atari's parallel port, or is the parallel port on the Atari too different from the PC parallel ports to achieve this?

I seem to recall that at some point, Dan's OVLs began using calls which
are not in the older, noncommercial, versions of CAB. I don't have the
docs in front of me at the moment, but you should check the docs because
this change was clearly noted.

> parallel ports to achieve this?

I don't know, since I don't know how Rio's parallel-port works. But it
should be very possible to port the Rio-software for linux to TOS (or
atleast MiNT), perhaps by supporting W&L's parallel-port for the
ROM-port.

Source record: 85661

The simplest method is to format blank disks
to 720K in the P.C. then use them in the Atari.

If the disks are formatted in the Atari they
will not be recognised correctly in the P.C.

The port is actually fitted to the bottom of the
Keyboard. This is really easy to remove.
once the lid of the machine has been removed
it just lifts out.

Then find someone who can solder to resolder the pins.

P.S. If you get really stuck I may be able to supply a replacement keyboard.

You could possibly try the latest CAB OVL which is 1314 Beta.

This is a known problem and has been resolved in NEWSie 0.94 (not yet
available). The previous version 0.90 did not have this problem, as
it was introduced in version 0.92 with Selective Mail retrieval.

It is really unfortunate that none of the beta testers have an older
TOS version to check these things out.

If you can send me email, I will let you know how to get the beta
version for validation.

> PC.. :)

My experience has been somewhat more problematic.

I had a lot of trouble at first, then everything suddenly started working after I checked the modem's serial port speed was the same as the MPC serial port setting. Then the PC broke (quel surprise...), and since it came back from being fixed the problem's back again (files restored from backup, so as far as I can tell everything should be identical).

I can connect with both STinG and Iconnect, and with STinG pinging and resolving works OK (haven't checked pinging etc with Iconnect). However the minute you start to do anything with clients, eg CAB or POPwatch, the connection locks up, with a slowly incrementing number of dropped packets. Occasionally CAB has loaded half a small page before it happens. As the problem affects both stacks (and it's not a CAB.OVL problem as it affects POPwatch, finger clients etc), I'm not sure what to do next, so any advice/ideas would be welcome.

Everything seems to work OK with Windoze, so I guess the modem is OK.

I'm stumped!

Source record: 85670

Interresting. I recently asked the same question on the MiNT list.
The answer is:

The 0.54 package found on ftp.funet.fi (among other sites) is the
last one that works correctly for me. You must create the file
/etc/xtab (which is replaced by /etc/exports on newer Unices) and
make sure that the dir you want to mount is readable for "Others".

There was a port of a newer version of NFSD and MOUNTD fron some
other Unix, but it hasn't worked for me.

Thomas Binder recently published some C bindings to correctly
support longfilename handling. Those were mailed to the MiNT
list, a while back. Perhaps that could help you? ;-)

You don't have to, but you can if you want to. I personally keep all the
listed files in the AUTO folder since that's where I'd look for them when
wanting to change anything.

> Can you have a line like path=C:\system\
>at the top of that file or do you have to assign a pathname to each app?

I don't think so. It seems to be just a list of application pathnames. It
doesn't matter what the extension is either since Magic assumes that any
line in the file without a ';' is a program to execute.

This made it a bit easier for maintaining them, for me anyway, since I
renamed all the apps that I use under Magic with the extension .APP.
The only exceptions were for those that are also needed under plain TOS.

>Otherwise I can see mucho confusion! :-))

That's why I renamed most of the files. Pity TOS doesn't use the extension
.TOS as that would make it even easier :)

I found out that some sites do not like the HELO and ALLOcate
commands.I had a problem uploading my web site to Freeserve.I
connected to the server ok,went to upload my site and the server just
hung and would not accept the file.I don't think,could be wrong,that
you could disable these two commands in aFTP.I had to revert to
Newsie and disable them in the preference,ftp menu.Once I disable
them I could upload files with no problems at all.

Just a thought...

1572. CAB problems with Altavista Translation

Newsgroup: comp.sys.atari.st
Date: 1999-01-24 00:00:00 UTC
From: wanda@xnet.com
Message-ID: <78eaimlmo1@flood.xnet.com>
Source record: 85729

If you go to http://babelfish.altavista.com/cgi-bin/translate? you can enter a URL such as www.milan-computer.de/html_d/index2.html, press the Translate button and get a translation of the page.

With CAB, pressing the Translate button gets you nothing but the same page redisplayed. I found that if I press Back then Forward, and then maybe select the URL button, select this page and press OK, sometimes I get the translated page.

I've tried this with CAB 2.5d and the 2.7 demo -- same problem.

Can this get fixed?

1573. ST and SuperDisk LS-120

1574. More ST questions...

Newsgroup: comp.sys.atari.st
Date: 1999-01-24 00:00:00 UTC
From: Prince Corum <corum@sasquatch.com>
Message-ID: <78ekcn$me5$1@news.sasquatch.com>
Source record: 85731

I recently bought a 1040STfm cheap, so no more fiddling with my two 520STm machines, but now I have new info I'm currently seeking...

I have a Tweety Board I want to slap into this thing, but it has three RCA style outputs marked "A", "B" and "C". Does anybody know why there are three and what the third one would be (aside from left and right audio out)?

With this Tweety Board, will I be able to use prgs with STe intensive STereo sound?

Can I use this machine as a newsreader and e-mailer?

I have TOS v1.00 on all three of my machines. Okay, once you're finished laughing, does anybody know if I can simply put newer TOS chips in there and if so, where I might get some?

Please let me know if any of these things are possible as I have always loved the ST and have always regretted getting rid of my first one years ago (that's why I'm jonesing for STuff now) and am trying to regain lost footing.

Thanks 1,000,000!!!
Louis

There's a little prog that writes an extra bootsector on your IBM format
disk. After that the disk can be read or written by both systems, although
PC software will NOT run on your Atari ofcourse.

If you need the prog mail me and I'll try to find it. Must be around
somewhere in my disk archive.

> maxboot! (My ST just used a few seconds!) Is it necessary that my Falcon
> is searching around for a disk or a HD for so long time? And what can I
> do to solve the problem? I will be glad for any help!

If your Falcon doesn't have an internal IDE drive it's searching for that
- plus you may be getting the Memory test. If you do get the memory test
simply hit the space bar to stop it.

To get your Falcon to boot quicker, use FASTBOOT.TOS which bypasses the
memory test and looking for the IDE drive. I'm sorry that I don't know
where you can get a copy, but if you email me I'll send it to you (it's
only 2K).

Hope that helps

Andrew Harvey

Nonono. You leave the programs in the Auto folder and put AUTOEXEC.BAT
there too. If it's present, MagiC uses it. The files themselves are
untouched. This isn't like a boot manager that copies/renames/moves files
around, it just turns the running of Auto programs into a script rather
than relying on the physical order on the disc.

Actually, the pixie better bring 720k disks:-). Thats it. You can use your
PC to unzip files and unlzh if need be.

ftp://atari.archive.umich.edu and go to the archivers section to get zip and
lzh for the atari if you want to unzip on the ST.

Hi Terry. I don't think it is corrupted. But I am going to try another one.
Perhaps it is not TOS 1.0 friendly anymore, or CAB 1.5 friendly? I wouldn't
even be upgrading except I cannot access the ATARI.ORG subdomains, which I
am told requires a newer overlay.

Well to talk to myself, I am using NEWsie .82:-).

NEWsie .92 locks up my 2.5meg 520ST whenever I close a window. All functions
and features work, but not being able to close a window either online or
offline limits the programs use.

Anyone else have this problem in a single OS system?
Any other Earlier TOS users out there, or am I still the only one?

The Tweety Board gave an output for each channel on the Yamaha sound
chip. All ST/f/m/fm's have mono 3 channel sound, driven by a Yamaha
chip whos number I can no longer remember. As a side note, its the
same one used by Sinclair /Amstrad owned Sinclair 128/+2/+2A/+3
Spectrums. In case you ever need a spare.

>With this Tweety Board, will I be able to use prgs with STe intensive STereo

No, the Tweety Board did not give any enchancements to the sound
system, or the OS calls.

>
>Can I use this machine as a newsreader and e-mailer?

I had to do the same to my orginally 520STfm. It depends on how may
roms you have. Some use 6 and others 2. But as long as you get the
replacement set with the correct number, no problems.

The only emulator that handles MIDI is PaCIfiST, and this is only a
kludge, with no MIDI-in and timing problems.

Why not keep your ST for MIDI, and use the PC for audio only, synced to
the ST, that way you minimize the PC's bad timing.

1591. Looking for a PC version of an ST game.

Newsgroup: comp.sys.atari.st
Date: 1999-01-25 00:00:00 UTC
From: t_gawthorpe@my-dejanews.com
Message-ID: <78hqh1gun1@nnrp1.dejanews.com>
Source record: 85548

In the early 90's, my cousin had an ST. One of the games we used to play was called "Maze". Does anyone know where I can get a PC conversion, or nearest equivalent?
As I recall, he got the game from an ST User magazine cover disk.
The music of
the game was Moonlight Sonata by Beethoven. You could design
mazes on a
grid of dots by joining dots horizontally or vertically (rather
like playing "Boxes") to
create a maze. Then the two players would run
around the maze, in split-screen
first-person perspective, and either try
and shoot each other or tag each other,
depending on the type of game they
had chosen. One of the players was a
glowing red strip, and the other was a
glowing blue strip.
If anyone knows of a similar game for the PC, or any
ideas on how I can get it to
run on my 486 DX2 66 PC (which emulator to get,
where to get the game, etc)
please mail them to t_gawthorpe@hotmail.com.
All help much appreciated.

>

Erm... The OS is in ROM. When you boot the machine, it should come up
after a few minutes. If not, then you have a hardware problem or some
software conflict. There is no system disk or alike.

The HD upgrade is easy. The drive is a 2.5" unit like those used in
laptops, you can put in a 3.5" IDE drive if you have a 2.5" to 3.5"
adapter. You'll probably have to cut away some of the shielding too.

Sounds like Midi-Maze. You could connect 16 ST's together through a Midi
ring and play simultaneously, a bit like nowadays' Quake deathmatches.

Not sure if there's a windows version, but there are several Linux
versions:
http://home.tu-clausthal.de/student/iMaze/
http://www.cs.tu-bs.de/~harbaum/the_maze.html

Try here too:

From: wordworks@ctos.com
Message-ID: <36ac961a.0@news.weldlink.com>
Source record: 85554

Does CAB absolutely require graphics files to be in the same directory as the HTML page that uses the grpahics?

It doesn't seem to be this way in the Windows world. 5 browsers there I've tested will read graphics files from a subfolder 1 level below the folder containing the HTM file. CAB 2.5 will not.

I want my web page to be CAB friendly, friendly with as many browsers as I can test, and if it cannot read graphics from a subfolder, then I will have to restructure my page setup.

Thanks.

Nobody hasn't mentioned Sentinel by Firebird. This was one that had me stuck by the screen for hours. Very simple but still so challenging...

One frustrating game was Transarctica. Anyone finished that on the Falcon? Even though every third save resulted in a system crash, I almost managed it to the end. I think I found all the secrets hidden, but when I tried to get to Himalaya (that -was- the target, or?) I never could get rid of that wolfpack, even with a train full of all possible weapons... would have been a great game without the bugs. Was the ST version working?

Markku

Martin-Eric Racine (q-funk@pp.fishpool.com) wrote:
: Interresting. I recently asked the same question on the MiNT list.
: last one that works correctly for me. You must create the file
: /etc/xtab (which is replaced by /etc/exports on newer Unices) and
: make sure that the dir you want to mount is readable for "Others".
:

The Servers of the nfsd of Version 0.5x are not reliable. I do not recommend
using them. But for doing olcal mounts you will need nfs.xfs out
of this Package!
Try the new port from linux instead. It is working fine. just remember:
1. For this Port you _need_ a portmapper-daemon running.
2. This Port works with /etc/exports, not with /etc/xtab
3. When mounting a Directory on your mint-machine you _must_ mount it
to /nfs

example:
My Linux-Machine shares /public (there is a corrosponding entry in /etc/exports)
To mount this directory on my hades I need to run nfs.xfs (put it in
c:\multitos) and then I'll have to mount it using the follwoing comand:
"mount linux:/public /nfs/linux_public" Where "linux" is the name of my
linux-box and "linux_public" is the name that will appear later in /nfs.
Note that the Directory "linux_public" is not allowed to be present before
you are mounting the share!

The nfsd from the 0.54 Package will create Errors and timeout when having
big files or lots of files in one directory (for e.g. 200 or 400 Files or
even more)

I'm afraid that's impossible. It's just about possible to play MP3s on a
Falcon with FPU, but anything below that will be really struggling.

I rather think that he has not enough memory after having loaded all
this stuff ..... The SLM needs a lot of memory, above all when a big
part of ST ram is already busy by other tasks ....

Certainly Cab, no matter which version, will read files from subdir.
Take a look at the lines beneath. I use this on my pages.
<A HREF="../../../aq-kortrijk/index2.htm">
<IMG SRC="../../../pics/fish/apl_lineatus.jpg" >
<IMG SRC="picto/logo-tsi.gif">

AFAIK. You must make sure that if links are in lowercase then the files
must be in lowercase too. With other words: MY_PICTURE.GIF isn't the same
as my_picture.gif

Sorry for that, but as I've read the question above, it seemed _obvious_
to me that he just asked not for the OS itself, but for the "system
software that came with Falcon030". My Falcon came with three floppies
named "Language Disk", "Extras Disk" and "MultiTOS Floppy Boot".

If that's what was requested, please email me (draco@mi.com.pl), I still
have these floppies...

You mean that it is hardly possible for Falcon's DSP to play
mp3 (mp2 it does well). 68030/68882 at 16 MHz is a bit too slow
even for mp2...

That's of course if we're discussing the actual realtime _replay_,
not just unpacking. To unpack a mp3 is possible on any computer.

It is a standalone TCP/IP stack complete with a command line driven
shell. The command line is complex which gives it its power but this
also makes it very hard to configure.

>which may provide PPP access to the internet on an 512k ST?

I can't remember: it *might* just fit - it certainly works on a
1040ST. Trouble is, like all things online you tend to amass lots and
lots of data so a hard disk is almost essential.

As for protocols, Nos does PPP and SLIP. On top of that it'll do SMTP,
POP3, FTP and TELNET (and some other stuff which I forget). It is
currently maintained by Mike De Petris ...

mike@interware.it
www.interware.it/users/mike/

... and is on the way to providing support for Cab.

Generally speaking, you really need a minimum of 1Mb of ram but as
this involves some effort with an ST machibe you might as well give it
the full 4Mb. It is often easier to locate an STE and put 4Mb into
that instead.

>to explain this????

Yeah. Something has cocked up!

Tos has no system call to "move" something and no system call to
"copy" something. These have to be written; but Tos does have a call
to "rename" something called Frename. It might sound odd but Frename
is capable of moving files about! It is only capable of doing this on
the same partition though - if you try and get Frename to rename a
file to another partition it'll do nothing except return the
(originally) undocumented "cross device rename" error code, AEXDEV
-48L. It just so happens that if the old filename and the new filename
are both in the same folder that only the directory entry name is
altered - ie the order of programs in the folder doesn't change. In
all other cases the order can change.

Why am I mentioning this? I dunno really! Maybe the above might allow
you to figure it out yourself. It isn't uncommon for programmers to
write a "move" function which uses Frename when the old name and new
name are on the same partition. When they aren't, they have their move

function automatically invoke their "copy" function then have "move" delete the original filename afterward.

Naturally there's many ways of going about this. A program might have reasons for *always* copying a file then deleting the original to accomplish its moving operation. This would always affect the order where both files are in the same folder. If an application thinks it may have to change data in the original file it might generate a temporary file. That way it can delete the temporary file should the user 'cancel' and want to revert to the original. If the user doesn't want to cancel then the app deletes the original file and renames the temp file to the original name: but as far as folder order is concerned the damage is done however because a copy has effectively taken place.

Leaving all that aside, a more subtle bug comes to mind. Given that a programmer has written a move function like I describe above, how do they tell if the source file and destination file are on the same partition? By looking at the drive letter of both filenames. In old Tos all names are converted to uppercase but these days they might not be. Comparing c:\ and C:\ might be causing some bit of code somewhere to think it is working with two different partitions so it copies then deletes instead of using Frename.

Just a thought! [and a very long one at that] ;-)

PS. Try making the offending auto folder program "readonly" in the hope the culprit displays an error message when it can't rename it.

if the LS-120 is an IDE device (probably) then you should be able to use
it with an upcoming card from Mario Becroft for 150$ NZ (100 U$A?) You
might need a different cable to attach it to an IDE port though.

There are some general programs that edit the keybord. I did use
Harlekin for this. The best solution is to use Okami for news and mail.
It does even correct the Atari ï¿½ you typed to the ISO-8859-1 character!
(look above). Also handels quoted printable (QP) both for mail and news.

1628. Evolution and Chameleon software wanted

Newsgroup: comp.sys.atari.st
Date: 1999-01-25 00:00:00 UTC
From: sonik@zetnet.co.uk
Message-ID: <78it85$le2$1@roch.zetnet.co.uk>
Source record: 85585

Greetings all fellow Gates-avoiders!

Any help on this would be gratefully welcomed so please bear with me.
Today I bought a seven - year - old rack synthesiser called an Evolution
EVS1. It's got the potential to be a great synth...providing I can crack
its programming structure. But I need some help and so this is why I've
come to you, fellow Atarians. I hope you can help.

I rang its manufacturers today and they directed me to their website, which
is comprehensive and features free downloads of user-editable sounds - 200
of them to be precise - as well as some specially-written Atari editor/librarian
software. Only problem is that the links for these are not of the straightforward
'point, click and it starts downloading' type - oh no , nothing that cosy -
these are actually links to an FTP site and my copy of Newsie doesn't like 'em
one iota.

So if a kindly Atarian muso is out there and can either pull down the files
(both sounds and editor are zipped and quite small) for me and e-mail them,
or in fact already has them and can let me have a copy, I'd be a very happy
bunny. Also if anyohe has Chameleon editor/librarian software they don't need
anymore please mail me as I'm looking for that as well.

Finally, my eternal thanks go to Andrew Harvey from this NG who helped me immensely
when I wanted to upgrade Calligrapher - it's now in fine fettle but printing can
be a bit hit and miss sometimes! Anyone else found that Cal likes to draw black
triangles on your printed pages at all before giving up?

Cheers everyone and keep on keeping on! :0

My 40MHz Falcon/Afterburner is just powerful enough to decode mp3's
realtime, I don't think any 030 can do this without sacrificing a lot
of quality. Can anyone with a CenTurboII confirm this?

However, I know of atleast one, cheap DIY hardware-decoder with a
parallel interface, as soon I can lay my fingers on one (and build
it!) I will attempt to write a driver for it (perhaps with some
additional hardware).

>will not be recognised correctly in the P.C.

Depends on which version of TOS you've got and on the PC. More or less
all the discs I've got, some which were formatted with TOS 1.0, can be
read on my PC. The only ones that fail are either DDs with 11 sectors
per track or HDs with 22 sectors per track. Since I don't have many of
these format discs around it's not a problem.

Another way to virtually guarentee compatability, while still using the
Atari for formatting is to use FCopy3 or Kobold. This will let you
format discs with 800Kb/1600Kb, or higher, capacity while still being
readable on a PC.

KM> Can anyone recommend one that would run on a Falcon or STe?
KM> I've heard of Home Accounts 2, ST Accounts 2, Mega Cheque 2 (what's with
KM> the 2's? :-)

Hi Ken,

I tried quite a few, including ST Accounts which bombed on my TT, but
finally settled on Phasar. Even though it's a little long in the
tooth, and has file handling that was originally designed for floppy
disks (but will work on hard disks alright), it has the most features
that I require. It will handle many accounts, sources of income and
expenses. I've tested it for Y2K compliance, since it displays the
year with two digits. It works fine, with the only problem being that
it displays the year 2000 as a single 0, which confuses itself -
when you enter a second transaction for the same date, it will forward
the date from the previous transaction - but the single 0 causes it to
display an alert, saying that a single digit is invalid. Once you
correct it to 00, it works fine, and knows that the year 2000 is
what's meant.

I got mine from Howard at one of the TAF meetings, but I've seen used
copies showing up here in the newsgroup from time to time.

Regards,

The BBS operated by TAF is connected to the Internet and members have
a free e-mail account at taf.ftn.org adresses.

Ask Daniel Dreibelbis or Ken MacDonald (they often post here).

Interrestingly enough the whole series of TCP/IP protocols were
developped to facilitate BBS in converting to the Internet, and
effectively become service providers.

Mikko Larjava (a contributor of the MiNT list) recently wrote his own
BBS software, designed to run as a MultiTOS application (uses Iconify,
etc.) and it can receive calls from serial ports or thru a Telnet link
and Timo Tiihonen's BBS operates on that.

Ask either Tiitsu or Samase on IRCnet #atari for more info.

I placed my 2.1ga drive inside my TT today and put the 548 meger in the old supra drive case that I use with the ICD host, this is pluged into the DMA port.

While I was moving batchs of files from the 500 drive to the big one I would get a box that said something like "Out of TOS Range for this appation" or something like that. Yet, if I made a folder, I could drop everything into it without that dialog box poping up. Just why do I get that if copying files to the drive, yet it doesn't show up if I make a folder on the same drive.

>
> Does anyone else have this problem or knows what is causing it?
>

Sorry for the long overdue reply, but you know how hectic life gets ;)

Anyway, I was one of the people responsible for the update to SAM which allowed it to correctly use SAA files. This version, together with a program to create SAA files themselves was distributed on an AC reader disk. I've also been meaning to put it on my web pages for ages, but keep failing miserably.

Although I didn't work directly on the code for SAM (I dealt with the look and feel, and bug testing, of SACK, the SAA maker), I remember Anthony Jacques saying that it was basically a horrible kludge in many respects. That's not totally the fault of the original programmer, as much of the kludginess consists of special casing parts of it to account for various versions of TOS.

Anyway, given the state it was in - and givent hat it was really intended just to add short sound effects to system events, I'm not surprised that there are problems. I recall that it also got very annoyed when you pointed it at a directory with too many sounds in it.

All I can suggest is either moving some un-needed sounds to another directory or increasing the size of the memory buffer in SAM. If neither of these work, then you'll have to do what we did, and get in there with a disassembler ;)

Thanks for the tip. If anyone else wants to give this a go, note that the normal DOS version has the coloured icons (they call them "tiles"), but they need to be enabled in NETHACK.CNF. The Mac version appears to be without them :(

I still prefer the GEM version, as I like to move my stats to the top of the screen, below the messages, but until I find a satisfactory way to run it, I guess I'll stick to the PC port under emulation.

It could all be academic soon, anyway, as there's apparently a Y2K problem with older versions of Nethack which could break the GEM version :(

I wanted to be surer that it wasn't down to a closer relationship between
CAB2.7 and the overlay for IConnect before going further - in general you're
absolutely right of course.

In this case I don't suppose that it's too difficult to make the overlay
distinguish between a local or remote page.

>>>In general (don't flame me) I like the ASH products, but this program is

Care to elaborate Peter? I know that issues are the lack of line wrapping
in the editor and choosing messages to download for offline reading isn't
possible.

"Prince Corum" <corum@sasquatch.com> sez:

C > I recently bought a 1040STfm cheap
C > Can I use this machine as a newsreader and e-mailer?

Sure. You need to get an ISP that does 'shell accounts'. This is not impossible; both Primenet and Cyberhighway can set you up, but there will be _some_ blank looks here and there. After that, you can use your ST for all things Internet, although graphics won't be there. You will need a 9600 or better modem for cyberhighway - don't know about Primenet, but I imagine it is the same. You will also need a terminal program, but this doesn't have to be very elaborate - I'll bet I could even do it with the VT52 emulator (emulator.acc) that comes with every ST.

C > I have TOS v1.00 on all three of my machines. Okay, once
C > you're finished laughing, does anybody know if I can simply
C > put newer TOS chips in there and if so, where I might get some?

I'm not laughing - some games, as well as some applications, will only run on TOS 1.0. But I would recommend that you install TOS 1.4 (Rainbow) or above on at least one of your machines, probably the 1040. TOS1.4 ROMs should be available from any dealer. You could also try for a TOS switcher of some sort with TOS 2.06 as your second OS - NewDesk TOSes (>2) are a vast improvement over TOS 1.x as far as your computing environment goes.

> working/thinking/hoping to link my BBS up to the 'Net someday. Hope does
> spring eternal, as the saying goes... ;-)

I agree the Net is one of the best things too... where your "store" in old
days was the BBS, it's now the Net... and a Superstore it is!

It also means you don't have to carry each and every bloody file you used
to on your BBS; there's lotsa FTP sites and Webpages that carry them. You
can limit your own stuff to things that are generally hard to find or
simply NOT available elsewhere. Even then 25 Megs is limited, but would it
be necessary to carry the latest Internet stuff on *your* site when it's
available elsewhere? This is the major difference between a BBS and a
website. Look at my own site: I never ran a BBS, but I had some stuff that
I would like to make available to others, so I put these up: SoftPC (which
is around on some other sites), Insignia stuff, which is NOT around
anywhere else (AFAIK), the Dutch Thing resources (the translator keeps
them on his site too), some info/textfile on an old Atari program that's
available from my site only and of course the Matrix graphics cards stuff,
that's not available at other places (hey M-E Racine, why not put a link
on your TT-support site to these?).

It also means organizing, who'se keeping what and where etc. Glad we have
this UTSI stuff, Martin informing us of what's new at the RMA and Hallvard
keeping us informed about FTP sites. That's what I like here: we still all
stick together :-)

> copy files from my IBM to my Atari through the 3.5" drives. Thanks.

The usual pointer => The Atari ST Quick FAQ at http://quickfaq.atari.org

If the ST has a double sided drive, just use 720K DOS formatted disks.
If you are out of luck and that ST has a single sided drive, then you'll
have to replace with a double sided one.

The most common cause for this is a dead disk drive. Try replacing it
with a PC one using the instructions from the Quick FAQ.

Hi

Why not drop me a line with 'Wanted: Arkanoid II' in the subject line
to: asx@steverosie.demon.co.uk and I'll see what I can do. I have had
this title quite a few times.

That sounds more like a bad battery. The Y2K problem shouldn't occur
before Jan 1 2000, really.

Anyway, to test if it is Y2K worthy or not, just set it to 11:55 on Dec
31st 1999, and see what happens when it ticks over to 2000, but you
should probably fix that battery problem beforehand.

>

I think someone (maybe you) already asked this question a week or two
ago. Nobody seemed to know exaclty, but my guess is that each RCA send
one of the 3 channels from the YM chip. Only a guess though.

> With this Tweety Board, will I be able to use prgs with STe intensive STereo
> sound?

Nope. It's not an STE sound system. It just brings stereo output to the
YM chip. Rather useless if you ask me.

> Can I use this machine as a newsreader and e-mailer?

Absolutely. 1 Meg is enough, but where are you going to store your email
and news ? a floppy will fill up quick, and be rather slow. It is
possible though. A ramdisk speeds up things a bit, but 1 Meg is not
much.

>
> I have TOS v1.00 on all three of my machines. Okay, once you're finished
> laughing, does anybody know if I can simply put newer TOS chips in there and

Upgrade to TOS 1.04 is plug'n'play. TOS 2.06 needs some soldering or a
special upgrade board, but is more advanced.

> if so, where I might get some?

From a broken STFM (1.04) or a Mega STE (2.06) or from an atari dealer.

You'll need the SCSI version. The ST's parallel port is incompatible
with most PC stuff except printers.

You could connect the LS120 to the PC, and use ghostlink through the
serial port. It'll work, but it'll take all night.

Probably not. The Atari parallel port seems to be quite problematic for
backup devices, scanners and such, so I wouldn't put my hopes up too
high.

There _is_ a SCSI version. Basically, it's the ATAPI drive with some
built-in SCSI-to-ATAPI adapter. I cannot remember who makes it, but
I recall several people mentioning that they are _much_ slower than
the IDE version.

Hello Again!

I am still having problems with the above situation! I tried using Z-control
and it is the same situation. It seems like it is getting it's default colors
from somewhere,(perhaps in a different resolution?) but won't save what I do
in colors.cpx. After saving configuration in Neodesk, I reload the INF and it
goes back to the "original" colors. Can anybody with a Falcon help me on
this?

Thanx!

I don't use any accounts packages, but it seems from discussions here that
at least some versions of Home Accounts are not y2k compliant, so it may be
as well to steer clear. I believe PHEM is y2k compliant, available form the
Probe House Software page, the address of which escapes me but I suspect
you may find a link on the UTSI.

Y2k seems to be something to watch out for with such packages.

This is basically all I did with my ST setup: copied it over. Still haven't figured out what I did to make it go and why it stopped. It wasn't STinG's setup that I altered.

> i'm
> not sure if to use the cpx or hs modem
> in the auto folder or what port to enter in the dial script.i just wanted
to
> see how cab went.

This I can help with. MPC comes with a version of HSmodem installed so I guess you need it. Not sure if it's a special version or not. The only modem port is Modem1 so I think you'll need to alter the setting from your Falcon. The serial port then appears as an upgraded Modem1 with speeds up to 115k in Peter Rottengatter's SERIAL.CPX.

When it worked, CAB was much faster than it was on my STE, not sure how it compares to the Falcon. However it is hampered by the sequential one-at-a-time picture loading and the slow image conversion compared to native Windoze browsers.

(OTOH, the CAB/Everest/OLGA combination is still my preferred method of HTML authoring. Nothing I've yet tried on the PC comes close.)

I don't think there is a SCSI version. Usually the LS-120 is ATAPI (IDE). You can connect this drive with IDE hardware extensions (don't know if you can still get one) and use current versions of HDDRIVER as driver. Other driver's won't do since only HDDRIVER supports ATAPI devices. (I have an LS-120 connected to my Falcon.)

It's a general problem with special national characters. The Atari
character set is not compatible with the ISO-8859-1 set used on the Net.
You need an ISO character set, font, and keyboard setup. There is a
package including a gdos font and ckbd somewhere called ISO-8859
something. Have a look at your favourite FTP site.

You need to get the lharceng.ttp from just about any Atari FTP site.
There's a small list of the main FTP sites in the Quick FAQ, as well as
a link to Hallvard Tangeraas' Atari launchpad that has the updated FTP
sites list

http://quickfaq.atari.org
http://launchpad.atari.org

There's no "old" or "new" TOS. It can be 1.0, 1.02, 1.04, 1.06, 1.62,
2.05 or 2.06.

You should use sysinfo.prg, downloadable from the Quick FAQ to know the
truth about your setup.

I think Arkanoid wouldn't run on the STE, that is from 1.06 onwards.

1671. What about using LZH ?

Newsgroup: comp.sys.atari.st
Date: 1999-01-26 00:00:00 UTC
From: Vincent.Barrilliot@esial.u-nancy.fr
Message-ID: <78k4mimtb1@arcturus.ciril.fr>
Source record: 85601

Hi,

Like many other Atari users, I have long filenames on my system.
ST-ZIP doesn't support them, and when extracting an archive it puts filenames into capitals ...
LZH seems to be quite better, it supports long filenames, there's a very good GEM shell for it, it's faster and even if the compression rate is slightly worse, I think it worth taking it as a standard.
What do you think about it ?

Vincent

PS : let's move on, shall we ? ;))

Maybe someone should take up development of ST-Zip to include long
filename support. Zip on the PC definitely does and I find zipfiles are
more convenient because it's available on most platforms. This makes it
easy for people to download from the net and zip to a floppy to port it
directly over to an Atari.

What I do find annoying is the .gz and .tgz that is used for most MiNT
stuff. Why not use zip or lzh like everybody else? Not all MiNT users
like fiddling with tar and gzip in a unix shell.

If I come across programs that don't like the specific TOS I'm using,
whether it be 1.62 or 1.2, I use TOS 1.09 (the one that comes on disk).
This will get most programs that can be run from the desktop working,
even STOS program. I've never used this on a half meg machine, so I
would think that for large programs you would need a one meg machine.

If I can get my hands on 'Revenge of Doh' I try it out.

I used to use an ST on the net, actually it was only 4 months ago I
started to use a pc for the internet. There are several programs for can
use, the most popular are STiK or STinG.

I used STinG to dial up and Newsie for my email, newsgroup and FTP
activities.

There is No reason that anyone having access to SLIP or PPP protocols
can't get on the internet with an ST, hopefully the CHAP protocol will
be added.

C'est un peu complique : tu doit d'abord trouver un cable
d'alimentation dans un vieux PC (tu dois pouvoir en acheter dans
une boutique une boutique) avec des fils rouge (+5v),
jaune(+12v) et 2 noirs (masse). Il en faut environs 10 cm.
Tu denundes les fils sur 5 mm et tu etames au fer a souder.
Ensuite tu debranche le falcon, tu le demonte et tu mets
l'interrupteur sur ON (pour vider les condensateur qui risquent
de te foutre une poignee de chataigne "qui reveille"). Tu
devisses les 2 vis qui fixent l'alim sur la carte mere et tu
retires l'alim du falcon. Tu devisses ensuite les 4 vis qui
fixent l'alim sur le support en metal pour acceder aux soudures
des fils rouges(+5v), bleu(+12v) et noirs (masse). Tu soudes le
connecteur a cet endroit : rouge sur rouge, jaune sur bleu, noir
sur noir. Les voltages des fils sont marques sur l'alim du
falcon et sur le connecteur du HD.
Si tu te gourre et tu envoies du 12v dans le 5v du HD, il est
foutu.
Voila c'est tout.

... and sorry for my french ;-)

No, I'm using the very same files, identical, to the ones I have on the windows machine.

Uploaded the setup to my ISP's server tonight, and they work fine in Netscape, but not in CAB.

Does the CAB.OVL file have anything to do with this? Maybe Dan Ackerman is watching??? <G>

actually, internal and external SCSI LS-120s exist, but not from
iMation - another company has bought the rights to do their own SCSI
version. I forget the name of the company (I saw it at a computer trade
show last year - Toronto Comdex or Internet World) but I do remember
posting the name sometime last year, doing a search via DejaNews should
find it....hold on, let me try something....

okay, checked DejaNews - it's a US company called WinStation, and
it's called the SLS-120. Didn't put down the company's number, though.
It was shown at Toronto Comdex last July.

If you drag the folder itself (and not its sorted contents) the order will be preserved. This is true for both Atari's desktop and NeoDesk. In NeoDesk, if you really want to preserve the order on a folder's contents, just go to No Sort mode first.

The basic reason for this is that when copying, it's fastest for the program not to sort the contents of a folder first. If you're copying a folder that is not already opened, there's no sense in sorting the contents.

Is it C? I may be interested. I did TT-digger.
But it's big.
I am in a intermediate mental state.
All of my easy projects have finished.
Most of my difficult projects can tolerate some thinking.

Henk.

1686. WTB: Sound Module

I'm trying to find a secondhand Roland CM-300 or CM-32L Sound
Module. I would obviously prefer to buy from someone in South Africa but
could consider purchasing from a UK based seller.
Any Offers ?
Ted Parrett

1687. IBM SCSI drive question, again

Newsgroup: comp.sys.atari.st
Date: 1999-01-26 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <36ade3bc8a9d80@holleman.demon.nl>
Source record: 85617

Hi,

today I finally got a replacement for the "faulty" drive I bought in
november and had sent back.

This time it's an IBM 664 type, SCSI-2 drive.

As with the old 663-type, I have the same problem. The drive is seen, but
there are no options to format, partition or whatever.

The story again:
The set here has 1 Quantum drive ID0, another one ID1, a Syquest-44 ID2, a
CD-ROM ID4. This one is physically the last one in the chain too and thus
is terminated.

The IBM drive was set to ID3. Using HD-Driver 7.02, the SCSI check goes
OK, drive is identified as 664, direct access type on ID3.0
When selecting this drive, all the options (read/write cache etc) are
greyed out. In the format/partitionize menu's the drive isn't listed.

So far so good (or bad, whatever the point of view is), exactly the same
as with this 663 type before.

I got some info from Djordje Vukovic before, where he explains about some
jumpers, JP5-6-7. 6 is for termination, that one is off, and the 5 and 7
ones are not even being mentioned in IBM docs.

So I tried with 5 and 7 both on, both off, 5 alone on, 7 alone on. No
change in behaviour.

And now for the strange part: this is all, setting the ID to 3.

I've been trying on ID 0, 1 and 6 as well: on those occasions the drive
showed up on the ID-test, but when selecting a SCSI device, it wasn't
listed at all! Only giving it ID3 will make it selectable in HDutils, but
options are greyed out.

I simply don't believe the drive's broken; it would be nr. 2 in a row...
Somehow there must be something that causes this behaviour (probably a
jumper setting). And again, as with the previous type, this drive ticks in
a 3.5 second cycle: one strong click, next a light one, this cycle repeats
endlessly.
The auto-spinup jumper has been set: applying power makes the drive spin
up normally, then after some time the clicking cycle starts.

I believe it was Roger Cain having a similar drive?
To complete the picture: all this on my TT, which has a SCSI-2 bus IIRC.

Anyway, input again is appreciated!

Not to my knowledge but you can use lots of other prg's.

Imagecopy CD 4.2 loads and save prog. jpeg.
1st guide loads prog. jpeg
Vision 3, Smurf 1.5, digilab 1.11 are able to load prog. jpeg. (demo's can
be found on the Belgian ftp site 193.190.205.13 atari/internet/graphics/)

etc......

That's because there is a limited number of file entries available in
the root of a partition, whereas using a folder allows this number of
files to be increased when required.

We have racked our minds over it also.
The only way to get it working is when a TV-cable operator goes
offering 24-hours Internet Connect with fixed ISP number and so on.
Then you can put the Atari computers with all de harddisks, CD-ROM's
etc. in a decent way on the net for download etc.

But it is all experimental here in Holland.
And what the cost would be if it is not-experimental anymore is
unknown.

Anybody in The Wet Netherlands that has such a connection? Then we
could experiment at least?

Hi Sean,

Yup. You can get a couple of different programs for editing RSC files.
Both RscView and ResourceMaster are shareware, go to:

http://www.cix.co.uk/~inactive/

IIRC you need to register RscView before you can make changes to a
file, but it's only 5UKP (and InterActive take foreign currency,
including US$). ResourceMaster costs more, as it's a full RSC
construction app.

Also, IIRC, William Wong has a utility that will convert .ICO files
for the Atari:

No, CAB use the same structure as any other browser, Netscape,
Internet Explore or Opera.

>

Have a look at one of the source files on my webpage, they are all made
with CAB and QED editor, and works with CAB, Netscape, IE and Opera.
Sometime IE doesn`t show the pictures in the right possition, but that`s a
Microsnot feature.

If you make your pages according to HTML 3.2 specs. you will be CAB safe.
All versiobns of CAB that I have used, show the pages just fine.
And I have used CAB from version 1.3 to 2.7, I only make some offline test with Netscape
and IE on a Mac Centris.

Thats funny, I had the intention to write you about this.
Well, I must confess, I cheat.
I'm running Netscape on a P166 laptop (second hand, affordable,
more than fast enough, COMPAQ Armada 1590DT).

I now can maintain 2 states of mind.
The one of a windows consumer. "I dont care what's in there as long
as it works." And indeed, that is what I wanted as far as the internet is
concerned. And I could have it NOW!! I could be shure that the cable boys
were able to install the stuff completely. Also A2000 garantees me the
working as such.
2 boys were in my house for half an hour. In fact, trimming the cables
was the hardest job.

The second is that of one that loves computers.
That's why TOS computers are still there, allthough rare.
I'm buying a MILAN060 all SCSI and 19" monitor.
I can do my real hobbies on the MILAN without bothering about
the enternet. That part of the computer does not have my special interest.
I leave that to others.

(Is there a condition called "computersmetvrees"?).
On the laptop I do nothing except the internet.

My laptop is equipped with a Ethernet PCMCIA card (seen as LAN).
From there a teeny tiny cable leads to a small black box.
You wont believe this.
From there a thicker white cable with a lot of threads leads to a
bigger black box they call a cable modem, and that leads to the
cable plug in the wall. I think that from there another cable leads
to a even bigger black box they call a provider. But it could just
as well be pure magic.

It costs f 89,= per month (EUR 40.38), but than you have
unlimited access.
MABN says that connecting a MILAN via a ethernet card to a cable
should work now, but I like this kind of redundancy anyhow.

All of this since A2000 has switched over to glass fiber.

My lower state of mind is not able to tell you any technicalities about this.
I'ts now typing this, laid back in an easy chair whilst occasionally
watching TV and reading the papers.

My higher state of mind au contraire noticed the last msg of a thread
headed 'floating point' a week ago. I couldnt read them anymore.
You know I am interested in floating point. Because of the line_f->$FA40
emulator. Can you give me a short summary of that discussion?
Stichting ST was involved.

I want to know if it is worthwile to make a software line_f emulater.
(The one that allways should have been in TOS)
But maybe it is allready somewhere around.

Greetings.
Henk.

1. TAR preserves links, ownership and accessrights, lzh doesn't.
2. GZIP packs a lot better than both lzh and zip.
3. PACshell support tar-files, so you don't need to use a shell.

Do you use HDDriver?
If so, have you set the bus arbitration option (i.e. have you given the computer a SCSI ID number)? If you haven't, this _could_ be the problem.
If you don't use HDdriver, I believe you should exchange your current driver software to HDDriver - it should make things easier.
I'm not sure if the IBM drive should work as I've heard about big problems with IBM's connected to Atari's from various people. Maybe Uwe Seimet knows a little more about it?

This makes me wonder what parts of MiNT are reentrant and
multitasking, and what is the difference between the two. Also, I
thought calling MiNT from MiNT was the basis for multitasking, aside
from having dedicated coprocessors. ("via trap" may the the key here
that I do not understand)

I don't see why it implies that. Is it because GEMDOS accesses the
DOS/BIOS/XBIOS routines directly?

>Sorry for (maybe) being too technical.

No problem. This is how I learn.

Greetings Atarians,

Now I have no problems with our Swedish characters anymore! :)
I solved things by installing CKBD 1.5 De Luxe and use a ISO-8859
font on my system.

I found no *.CKB-file for the swedish keyboard, but managed to adjust
the german file, and so I finally got it to work excellent on my
swedish Atari. :)

So, if there are other Swedish Atari-users out there/here that are
looking for a *.CKB-file to use, let me know.

Regards,

/Joakim

ZIP20 (I believe) handles long filenames and lowercase during
extraction; I've never tried the compression side of it.

The only problem, at least for me under MagiC, it sets the read-only
flag on every single file it extracts, making it a major PITA to
delete or move those files.

Hi there, with the new mini disk format available, and mini disk
recorders, has anyone hooked one up to a Falcon for recording to CD?
I was thinking this could be possible by connecting the optical outs on a
FDI to the optical in on a mini disk.(??)
This could offer an alternative to actually getting a CDR.
Just an idea,
Mark

I don't know, but it *may* also be that a) they don't have a 115V power
supply to hand, and more important b) with their fairly limited
production can't afford to get FCC approval (or the machine may not
pass it in its present state, for all I know). Just guessing....

On Wed, 27 Jan 1999, Louis wrote:

> Been thinking about it, mainly because of some slight discrepancies in the
> KGMD/KEMD textfiles (sorry Kath!).

hmm I don't think you realize what kemd was about.
I did 2 things:
translate the original kgmd from german into english, no
editing.(kgmd.txt)

2) wrote my own install based on the kgmd package. (kemdinst.txt)

So, of course they are different.
If you need info, or kemdinst.txt being too complicated, you can always
read the original kgmd install text.

I spent 2 months, had notes everywhere, testing, rewriting etc, Just for
kemdinst.txt. That's my own install basically because for some reason kgmd
was not totally accurate from what I could see.
By respect I felt I had to include the original kgmd txt. I guess I should
have not? too confusing having 2 installs?

I hope that this point is a little clearer :)

btw jpegem12 is out. (in few min I will upload it)

:AV-Protocol - ?
:API - ? (interface?)
:GEMDOS - ?
:
:AES - Is this what we know as the GEM Desktop? Alternatives:
: gem.sys, geneva.prg, Xaes, N.AES, and Multitos (AES 4.0)
:GEM.sys - another AES? Or is this MultiTos?

multiTOS. the Atari TOS. velly slow man.

:Geneva.prg - another AES? Multitasking. Comercial?

yes. see http://www.pair.com/~gribnif/

:N.AES - a new AES replacement. Commercial GUI for MiNT.

yes. see http://www.woller.de/ (I think)

:XaAES - free GUI for MiNT. Is this an open source project? Not
: completed yet?
:OAesis - another AES, free, open source project.
:
:Cab - Crystal Atari Browswer. How would this run on a stock
: ST in low or med rez? Should it only work in high?

I've run it in low rez, with a big screen. As CAB sees 16 colours it
will work in colour, but everything is dithered, and BIG!
Med and High rez are mono. High rez is fastest, esp with pics off!

:Stik - "ST Internet Kit" - a TCP/IP stack that handles only SLIP
: protocols. Few use it nowadays.
:Gluestik - A translation layer which lets you use STik/STinG
: clients with MiNTnet. It allows you to use STiK applications
: without STiK. Instead, you use MiNT+MiNTNet
:STinG - TCP/IP stack
: that handles PPP or SLIP protocols, which
: uses STiK's data structure (what does that mean?)
:Draconis - another tcp/ip stack, not compatible with any other, has
: its own clients, a browser called The Light Of Adamas, email
: client called Marathon. Was going to be commercial bundled with
: the Milan.
:I-connect -?
:
ASH, TCP/IP for CAB from Application System Heidelburg. You don't have
```

to use it, you can still use STing and the STing/STik compliant clients.

:Minix - another Unix-like OS.

also minixfs. MiNT can use the minix File System.

:MiNT'98 - ?

CD ROM from Whiteline in Germany. MiNT installation kit with latest MiNT.

:MiNTXFS - MiNT's file system?

MiNT new file system

:CDRomXFS - file system for CDroms.
:Spin.XFS - another CD rom file system.
:
:Thing - DEsktop replacement. Commercial?

shareware. see InterActive shareware site.

:WenSuite -?

french web browser

: Miscellaneous questons:
:
: 1) Why would a Minix file system be required to run MiNTnet?

it is not.

: 2) of AES, why can't one have a multitasking AES without
: a multitasking TOS (MiNT)?

Geneva is a mutlitasking AES that runs with TOS. Magic replaces
everyhting, so its not a mutlitasking AES. nAES needs MiNT.

: 3) The regular TOS file system can't be upgraded to use VFAT,
: right?
: 4) I'm still not clear on the difference between PopWatch and
: PopGem.
:
:
:Continued additions and corrections are appreciated. You guys are
:great!

Thanks a lot, you saved my day :-) I found a ttp-utility that actually managed to build bitmaps of the HPGL-files I had, something not even Paint Shop Pro could :-) The output isn't perfect, but a bit touching up with Megapaint and the PCB's should be ready for printing.

The following Atari ST items are for sale on Ebay:

Item #60221687: 6 Atari ST games: Space & Police Quest, MORE!

Item #60853092: Atari ST 3D Graphics Programming book w/ Disk

Item #60854876: Atari ST GEM Programmer's Reference Book

Item #60856348: Atari ST Machine Language Book

Item #60858025: Atari ST Learn C & From BASIC to C books

Item #60859590: 2 Atari ST Flight Simulator Books

Item #60860627: Atari ST COMPUTE's ST Programmer's Guide

Item #60862686: Atari ST Assempro: Assembly Lang Dev SW

Item #60863818: Atari ST GFA Basic Book & Disk

Item #60867583: Atari ST GFA Basic 3.0 Books & Disk

Item #60869382: Atari ST Laser C & Laser DB Dev. Software

Item #60870283: Atari ST Personal Pascal Dev. Software

Please check out all the details (descriptions/pictures) at

http://cgi3.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=tagrel

Thanks,

Dave

1731. ATARI MEGA STE problem

Newsgroup: comp.sys.atari.st
Date: 1999-01-27 00:00:00 UTC
From: tom.derrick@acpu.com
Message-ID: <917400036@acpu.com>
Source record: 85509

"Steve Hewitt" <stevehewitt@earthling.net> inquired:

S > Boots up OK but after 30-40 mins the cursor freezes and a
S > reboot is needed Any ideas ?

Two things that come to mind:
1) Are you sure that the mouse connector isn't knackered? sometimes I'll think that the computer is frozen when it is just that the mouse has become slightly disconnected.
2) More likely than 1 - your power supply is sinking slowly in the west. Replace it while that is the only thing that is putting its paws in the air. A bad power supply in an ST can take a lot of other hardware with it when it goes. If there is some question, check the +5V line - a real Atari mouse will keep going with this voltage pretty low, but a replacement like the Beetle mouse will stop working at about 4.9 Volts. Some ST power supplies can be adjusted - at least we did that once - but I couldn't say whether yours is, or whether it makes sense to do so if some of the components are failing.

Thanks to all for their suggestions. I seem to have found the problem, and it is CAB. <G> In this case it's CAB 2.5. I don't know if the problem exists with 2.7 or not.

I did indeed use a Windows program to create the HTML file, in this case Claris Home Page 2, but that was not the problem.

I did this on a Windows 98 machine, and it seems CAB has problems when it comes to handling the truncated long filenames. All files and folder names were long filenames, and CAB read the HTML file fine. But the subfolder and the files inside all had long filenames, and CAB would not display the files. I renamed the subfolder and the files inside to follow the old DOS 8 and 3 naming convention, and CAB displayed the files with no problem.

Since CAB displayed the HTML file just fine, I suspect it stumbled over the folder name, but I made no effort to check that suspicion.

To be safe, I also renamed the HTML file.

So, everything is now CAB friendly, AFAIK. The page is still under construction, so who knows what else I may stumble upon! <G>

On Tue, 26 Jan 1999, Nicholas Bales wrote:

> What I do find annoying is the .gz and .tgz that is used for most MiNT
> stuff.
blah.

Why not use zip or lzh like everybody else? Not all MiNT users
> like fiddling with tar and gzip in a unix shell.

1) I don't think it is a matter of to like or dislike the use of one
shell.
The important thing in an archiver is the efficiency, speed, compactness.

2) You have a desktop, do you?
what's hard to assign tar and gzip for the files? no need to use a unix
shell. Just double click on the file.

3) if you want it to be GEM driven, I think there is a shell for that. so,
no worry.

4) tar and gz are only used where needed.
In example, I pack unix stuff with tar/gz
but I release my soft with zip.
different purposes..

tar/gz besides, not even talking about long filename, attributes etc. is
quite damn efficient.. And more flexible than lzh for example (I use some
unix shell remotely, Needless to say that lzh would be quite stupid to use
for this purpose.

SO, several archivers are still needed.
Thank god we lost some of the really not good ones ;)
like arc, and zoo etc.

But well, that's just my opinion.

I juggle between zip/lzh/tgz depending the needs, Just like you would do
with image formats.
sometimes, you better off with jpeg. sometimes gif. and sometimes tiff.

All of them are good and bad at the same time.
All features with restrictions.
You to choose the best for the job :)
bye.

1735. Re: Help me learn Atari Vocabulary

Newsgroup: comp.sys.atari.st
Date: 1999-01-27 00:00:00 UTC
From: mhop@snip.net
Message-ID: <36aeb36b.519348656@news.snip.net>
Source record: 85513

A third installment of my vocabulary lesson. I've tried to group
words by their type.

AV-Protocol - ?
API - ? (interface?)
GEMDOS - ?

AES - Is this what we know as the GEM Desktop? Alternatives:
gem.sys, geneva.prg, Xaes, N.AES, and Multitos (AES 4.0)
GEM.sys - another AES? Or is this MultiTos?
Geneva.prg - another AES? Multitasking. Comercial?
N.AES - a new AES replacement. Commercial GUI for MiNT.
XaAES - free GUI for MiNT. Is this an open source project? Not
completed yet?
OAesis - another AES, free, open source project.

Cab - Crystal Atari Browswer. How would this run on a stock
ST in low or med rez? Should it only work in high?

Stik - "ST Internet Kit" - a TCP/IP stack that handles only SLIP
protocols. Few use it nowadays.
Gluestik - A translation layer which lets you use STik/STinG
clients with MiNTnet. It allows you to use STiK applications
without STiK. Instead, you use MiNT+MiNTNet
STinG - TCP/IP stack
that handles PPP or SLIP protocols, which
uses STiK's data structure (what does that mean?)
Draconis - another tcp/ip stack, not compatible with any other, has
its own clients, a browser called The Light Of Adamas, email
client called Marathon. Was going to be commercial bundled with
the Milan.
I-connect -?

Re-entrant - The same piece of code can be executed by several
processes or threads simultaneously. Could someone give
me an example of what can and what can't be reentrant? If
MiNT's XFS interface is not reentrant (or the trap handlers or
whatever), than does that mean that it cannot
multitask when doing disk i/o?

MiNT - MiNT is Now Tos. multitasking Kernal to allow TOS programs to
multitask. It can use external
file systems. It doesn't completely replace TOS, does it?
Someone said it replaces GEMDOS?
Does MiNT have a file system of it's own, or does
it use the standard TOS file system unless it is given a XFS?

Is this considered an "operating system"?
FreeMiNT - MiNT officially continues development under this name for
legal reasons of copyright.

MiNTNet - tcp/ip for MiNT.

MagiC - A TOS/GEM/AES replacement? Commercial. Can it use other XFS
file systems?

Minix - another Unix-like OS.

MiNT'98 - ?

KGMD - Knarf's German MiNT Distribution - Everything MiNT, in German.
KEMD - The English docs for KGMD

Newsie - a Newgroup reader that handles email, FTP. I don't
understand why or how a newsreader could use FTP. I thought that
was the brower's function.

PPPkit - a cut-down MiNTnet stack to allow internet access using MiNT
but without installing the Minix file system. A "Toy" version of
MiNT Net. Needs modernization.

WWW(kit?) - I do remember seeing this long ago. A distribution
initially
contained STiK and CAB, and other STiK cliens, but got too big
to include all-in-one.

MinixFS - Minix File System, with extended filenames, and can
be used by MiNT.
MiNTXFS - MiNT's file system?
CDRomXFS - file system for CDroms.
Spin.XFS - another CD rom file system.

Thing - DEsktop replacement. Commercial?

MT-Newswatcher - Mountain Newsreader is for reading BBS QWK packets,
not for the internet.

Newswatch - a news client for STiK/STinG which uploads/downloads in
various formats for use
with a range of offline readers such as Oasis, Snews, and Okami.
Not a newsreader in itself. [I don't understand why the offline
readers can't retreive their own messages]

Popwatch - Comanion program to NEWSwatch used to upload/download email
via STiK/STinG, uses the POP3 server, not the SMTP server. Not
for reading, editing, or replying to email. What is the
difference between the POP3 server and the SMTP server? As in
Newswatch, why can't the email client/program get its own mail?

PopGem - same as Popwatch, some say for MiNTnet, others say no, not a
MiNTnet client only.

Nemesis - A hardware mod overclocker for the Falcon.

NOSTalgia - ST emulator for the Mac.

XHDI compliant - Extended Hard Drive Interface. An interface
standard, but nobody seems to know by who. Is this an Atari
specific standard? Where can one find the docs?

FAT - File Allocation Table. TOS uses this. 8+3 filenames.
FAT32 -
VFAT - alternate file system as used by MagiC and Windows95. Long
filenames, case sensitive, that can be used on TOS partitions,
similar to the way
DOS can read Windows 95 directories.

WenSuite -?

Infiltra - email client for STiK/STinG.

aFTP - STiK application for FTP.
DuFTP - a GUI interface to the MiNT version of FTP.
Fiffi - Ash's FTP client

Miscellaneous questons:

1) Why would a Minix file system be required to run MiNTnet?
2) of AES, why can't one have a multitasking AES without
a multitasking TOS (MiNT)?
3) The regular TOS file system can't be upgraded to use VFAT,
right?
4) I'm still not clear on the difference between PopWatch and
PopGem.

Continued additions and corrections are appreciated. You guys are
great!

I understand now, I took you to mean that you actually had to phsically
disconnect and dial in again! :-))

>OK, you're losing some time, but not for a complete hookup. Have to try it
>with more files in one go; which wasn't possible using Newsie.

This is definitely one of aFTP's strong points ATM.

>>>sort out what was the perfect running order for MagiC to be "rocksolid"

>>
>Actually, I've written it down somewhere too. Gotta take a look. But since
>the last Mintversion was installed, the running order changed slightly (I
>can notice from my boot-sequence) and somewhere this causes MagiC to hang
>for no reason at all at times. It used to be ROCKSOLID!

It seems to me that the best way around this is to use the autoexec.bat
feature of MagiC - there's no way that a line of text will get swapped
around in a text file without human intervention!

Whilst we're on the subject of MiNT and since you've just gone through the
process of installing it, do you think it might be a good idea to write the
process up (preferably for your web page), I'm toying with the idea myself

but I'd really appreciate some kind of FAQ sheet or similar just to reassure myself that it's for me?

I've got both those checked, but I'm pretty sure that I had it working like
that, but I've also been testing Fiffi as well as aFTP so I'm willing to
admit confusion!

I also don't think that it's possible to connect to one ISP (in this case
CiX) and upload files to my Freeserve page or vice versa?

Not AFAICS, I guess that it's possible to distribute NeST etc packets via
email and there's gateway access to the newsgroups via some BBS's.

The strength of the BBS is probably more in local message areas.

> working/thinking/hoping to link my BBS up to the 'Net someday. Hope does

The Tavern BBS had a web page when it was running, but I don't think that it
was set up to act in the way that you described.

As fas as I'm concerned, when I want to get files from PCs, I use ARJ because
it allows the splitting of large archives, and also it exists on Atari.

Right, but you didn't explained what was, according to you, the advantage of
STzip on Lharc ...
I find it boring to rename all the "FILES.EXT" extracted by STzip into
"files.ext", and to not be able to access all the folders of my vfat partitions
from STzip (GEM shell)...

Bye

Vincent

Not necessarily. MiNT can run in text console mode without an AES. A bit
boring after a while, but it does work.

There is no problem except that especially for DPES 1 GByte drives
correct termination is extremely important. You also should turn
initiator identification/bus arbitration on. Except for this points
there were no problems with IBM drives so far.

Yep, Jo is pretty well right. I can't speak for C2 owners, but on my
Nemesized Falcon, 68030 at 25mhz, 33mhz 68882 FPU-accelerated to 50mhz,
the MP3 player will decode and play about 1-2 seconds of an MP3 song,
followed by about 5-8 seconds of decoding, then 1-2 seconds play, etc,
etc,... This is with the options set for lowest possible quality. ;(

1748. Re: mini disks

Newsgroup: comp.sys.atari.st
Date: 1999-01-27 00:00:00 UTC
From: "DJ VU"
Message-ID: <36af2439.243546107@news.pclink.com>
Source record: 85526

I use a minidisc recorder as a A/D converter going in to my FDI. Just push record without a disc in the machine. After recording tracks, I can mix down to the minidisc via the FDI. Only problem is the SCMS. It only allows 1 digital generation. I am looking at the new Tascam CD recorder.

On Tue, 26 Jan 1999 23:44:58 -0500, Mark Friedman <fried@achilles.net> wrote:

By US Code Title 47, Sec.227(a)(2)(B), a computer/modem/printer meets the definition of a telephone fax machine. By Sec.227(b)(1)(C), it is unlawful to send any unsolicited advertisement to such equipment. By Sec.227(b)(3)(C), a violation of the aforementioned Section is punishable by law.

1749. Re: What about using LZH ?

Newsgroup: comp.sys.atari.st
Date: 1999-01-27 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <19990127104420.09414.00003397@ng-fb1.aol.com>
Source record: 85527

In my own personal opinion, I prefer Lzh to Zip on the Atari but use both.

One reason is that I find STZip to be much slower when it either compresses or extracts files than Lzh is much faster.

And, since most Atari files are not that big to begin with, I'm not to worried about the compression ratio. If I were doing PC files that run into the several meg size catagory, then I'm sure I'd want the best compression. But when an Atari file is only 300k to 700k in size to begin with, then saving a 100bytes of space or so and a few seconds in download time isn't worth the extra time it takes STZip to compress/extract a file compared to Lzh.

I just prefer Lzh because of its speed, though STZip is an excellent and easy program to use.

Source record: 85529

Hello to all

Thanks for your response to my question about programs that are now freeware that used to be commercial or Shareware.

So far, the following programs appear to now be freeware:

-STOS Basic
-Two in One
-Connect
-RoboBop + other stuff from the same author
-Backwards 3.01
-SToop

Can anyone else add to the list? Are there any commercial programs that can now be distributed freely, whether they be games or utilities or applications?

As examples, are any of the following now free to distribute?

STOS Creator, Maestro, Compiler, 3-D, etc?

Any Dr. T's programs?

Diamond Back or Diamond Edge?

Timworks Publisher, Writer, Data Manager?

Any games such as Missile Command, Moon Patrol, Dungeon Master, Captive, or Civilization? Have any game companies (such as Ocean, Microprose, etc.) given permission for any or all of their titles to be freely distributed?

Again, I get calls and e-mail from people who want certain titles and if I don't have them for sale then I am frequently asked if I make a copy of the program for them.

Again, I ask this question because I don't want to pirate software (or even start up that debate again) but I am more than willing to help any Atari user in any way that I can. And if I can provide a program legally to someone who wants it then I am happy to do so.

Any comments you have or program titles that you know of that are now considered free to distribute would be greatly appreciated.

Thanks in advance!

Al Horton

The STOS compiler source was released along with the interpreter, so I am
pretty
certain this is freeware as well. Same goes for maestro (actually, thats
included
twice - once in the compiler and once in the interpreter distrib).

1755. Re: IBM SCSI drive question, again

Newsgroup: comp.sys.atari.st
Date: 1999-01-27 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <36af59863c9770@holleman.demon.nl>
Source record: 85533

Part II.

After getting some more info on the drive from the IBM site and fiddling with the drive jumpers, I finally got it to work: appearently the auto spinup jumper had to be removed, I set HDdriver to SCSI initiator etc on ID 7 and the drive showed up again.
This time HDUtils also listed the drive under the format and partition options.

The drive is listed as a 2 Gig device, and had only one partition of 1024 Mb on it.
Next I tried to repartition to make use of the full capacity. This wouldn't go right, so I decided to reformat the whole drive. In the sector test HDutils displayed around 51 bad sectors in the end, so I set the partitioning for 4 partitions, with the bad sectors not being used.

In the end HDdriver complained about "not being able to write data to disk" (?), next the drive wasn't listed under format and partitioning options anymore...

Next gave it a try with ICDformat: same stuff, after the sectortest it complains about a fatal error.

Try nr. 3 with SCSI-tools gives me "no Index/Sector Signal SCSI-Error 1"
Another one was "RAM-error with formating, SCSI-error 64".

SCSI-tools also tells me that it doesn't know about this drive and proceeding is at own risk...

So what's up here: special IBM tools required?/would it only work from DOS?/should I try formating from a PC machine?/Could it result from master/slave settings?

Appearently this drive was waiting for a sync signal with the auto spinup jumper set (hence the tick sequence), now it spins up after the HD driver starts and it looks like it's OK then. No ticking sounds.

Drive is listed by SCSI-tools, ICD-pro and HDDriver as IBM 0664 M1H type. (which is correct by the info I've gathered).

Errr... I don't think so. InterActive still list both versions as
shareware.

But, I believe ZOrg (hard disk tool w. defrag etc.) is now freeware.
In fact, it was announced about three days after I received my
registration key last year :-/

>myself that it's for me?

Been thinking about it, mainly because of some slight discrepancies in the
KGMD/KEMD textfiles (sorry Kath!).
But, I'm rather busy now: getting this drive going, writing two articles
for ST-News in Holland about aMail and Mint/N.AES (at the same time this
means also time to evaluate these items)... you get the picture.

So had Bearboard, not one, but four. Mainly to support Semper/jetmail/LED,
since those guys met every year and talked about future development. But
like I said, what can you do with 4x25 Mb's of space? Bearboard itself had
everything, ranging from 1985 software till the latest versions of
whatever, plus the complete Umich archive, etc. etc. etc. No wonder he
needed a 4 Gig drive for the BBS alone... :-)

Nope. You can run text apps without any AES at all, or use the SingleTOS AES for running one GEM app along with a bunch of text based apps, the latter probably running in TOSWIN windows (though I think that part is optional, it just works nicely). TOSWIN is a GEM window manager that runs as a desk accessory and lets you run multiple text consoles in GEM windows.

The main point to grasp here is that to run more than one GEM app (ie that uses the AES), you need a multitasking AES such as MultiTOS, AES 4.1, N.AES etc. Running more than one text app isn't a problem, AKAIK.

I don't know about PKZip, but zlib with examples are 100% C, and one
of the examples is a small, basic PK-compatible Zip-tool. You can find
zlib on any ftp-archive that has unix-stuff (i.e. almost all of them).

I have had a look at it myself, and one of my "long-term"-projects
(i.e. something I want and can do but don't have the time for in quite
a while...) is a modern GEM-tool with integrated lzh and zip. I can
mail you my notes re. zlib/"JES-zip" if I can find them.

Although my TT is running MagiC, I still adhere to 8+3 file names except
for one partition. This to keep Kobold 2.5 happy and for the fact that
some of my favorite applications don't support long names anyway.

BTW: It's worth mentioning that in all your posted articles, Turnpike
excludes the References header for some reason -- threadings are
trashed. Most likely a 'gateway' problem.

I would think so. I haven't seen it formally recognised that it can be
released as
a BINARY distribution, but the author has released the source code to all
three
bits that are mentioned - Interpreter, Compiler, and Meastro - and have been
officially
released as freely available, and the distribution of modified versions is
not
prevented. So... an unmodified version should be ok as well.

Hi Folks.......

ASP News....

MouseBurster is an interface that will convert standard PC serial mice (Micros**t or Mouse Systems compatible) into Atari mice. There is no driver software to run, just some option jumper switches for type of mouse, third button functions and speed (some mice can be very fast so there is an option to slow them down). They retail for 19 UKP inc P+P etc...

STartIDE is an internal fitting IDE interface for the STFM (STe version soon) with an optional TOS2.06 upgrade. It supports 3.5" and 2.5" hard drives and standard IDE CDROM's (should work with LS-120 drives too). It is perfectly possible to get a 2.5" hard-drive into an STFM without external case mods (some shield cutting required). Basic interface is 50 UKP inc P+P etc, fitting can be done by ASP or by Mick Lock at MJL Insights for 25UKP. An optional (but recommended) 64-way socket to aid in installation is 5 UKP, and 2.5" drives (mostly small) are available from time to time, ATM I have a 60Mb that is going for 20 and a 128Mb for 30 UKP Installation attracts a carriage charge at cost (Typically around 10 UKP, more for next-day). Installation while-you-wait is availabel at weekends by appointment only.

SCSI-Burster is a cable that turns a PC case into a SCSI case. Up to seven devices can be supported, works well with ICD Link type interfaces and also with ADSCSI cases. A basic three-device cable cost 18 UKP inc P+P etc, and there is a full service upto sourcing and housing the drives and cases to provide a turn-key solution. Typically a MIDI-Tower case with a 540Mb Hard-drive and an 8x CDROM with a spare bay will cost around 110 plus carriage, this includes setting up any software, you can have your old hard-drive installed into the case to leave the driver software untouched. For stripping an old drive of the drive and and ADSCSI board, and installation in the new case I charge 10 UKP, and you will need a terminator with the ADSCSI so if you haven't got one I can supply it for 5 UKP. Extendos (you must source yourself) I will install for free onto ICD (Link systems) or AHDI (ADSCSI systems) or if yuo use HD-Driver I will install it as well. If you want to save money I will attempt to set the system up with CBHD and Metados/SPIN but I can't guarantee success (Metados is a sod to get to work sometimes), it's free anyway....

PSU-Burster is a the name for a new family of cables that allow for the use of PC PSU's (AT form factor only, NOT ATX) to power Atari ST's and Falcon's. A MegaSTE variant could be produced if required. There are no modifications required to either the PSU or the motherboard, and they cost 6.5 UKP inc P+P. THe MegaSTE variant will be 10 UKP.

IDE-Burster is a suite of cables to allow the use of 3.5" form-factor drives with the Falcon. Lots of options available but the basic single device cable to put a 3.5" drive into a Falcon internally (it'sa squeeze but it will go) is 8 UKP inc P+P

I can replace case screws with 3mm machine screws into brass inserts, useful if you have the case apart occasionally, or if you're missing or have stripped a lot of the standard ones. The kit costs 2.5 UKP, fitting into a built machine is 3 UKP, into a stripped case top is £1, unfortunately there is a 1.5 UKP surcharge if this is ordered on its own to cover the cost of postage and bank fees, I'll do them while you wait at the show in April though, or at WAG (or anywhere else you run into me with the ASP stuff.....) Prices quoted are for all seven screws BTW, not just one :-))

Coming soon....

Keyboard interface for PC-AT keyboards,
RAM board for STFM to 4Mb
ST-VGA converter adaptor
Accelerator for ST (69030, TT-RAM, IDE and VGA), faster than a TT more colourful than a Falcon

CAB 2.5 has no problem with handling long filenames and folder names.
I'm not sure what you mean by "truncated long filenames." Why are
they truncated?

And you sure it wasn't a problem with case and not file/folder name
length? You will most definitely have problems if the file doesn't
match the case EXACTLY as it is in the HTML.

Source record: 85397

Hi ,

Am in the process of trying to purchase an SM124 from Canada however I
am aware that they have a 120v 60hz power supply with 60hz 1040
output on the monitor.

Is it possible to convert the monitor to run under UK mains?

I am an electronics muppet I'm afraid so I'm sorry if this question
sounds daft.

Cheers

Paul Mac

Sent using the power but without the price to boot.

paul_mc.NOSPAM@atariste.freeserve.co.uk

Ok, you asked for it. I looked this up for you at http://whatis.com/.
Here it is (copy and pasted):

MIME (Multi-Purpose Internet Mail Extensions)

MIME (Multi-Purpose Internet Mail Extensions) is an extension of the
original Internet e-mail protocol that lets people use the protocol to
exchange
different kinds of data files on the Internet: audio, video, images,
application
programs, and other kinds, as well as the ASCII handled in the original
protocol, the Simple Mail Transport Protocol (SMTP). In 1991, Nathan
Borenstein of Bellcore proposed to the Internet Engineering Task Force
that SMTP be extended
so that Internet (but mainly Web) clients and servers could recognize and
handle other kinds of
data than ASCII text. As a result, new file types were added to "mail" as
a supported Internet
Protocol file type.

Servers insert the MIME header at the beginning of any Web transmission.
Clients use this header
to select an appropriate "player" application for the type of data the
header indicates. Some of
these players are built into the Web client or browser (for example, all
browsers come with GIF
and JPEG image players as well as the ability to handle HTML files); other
players may need to be
downloaded.

New MIME data types are registered with the Internet Assigned Numbers
Authority (IANA).

MIME is specified in detail in Internet RFCs 1521 and 1522, which amend
the original mail
protocol specification, RFC 821 (the Simple Mail Transport Protocol) and
the ASCII messaging
header, RFC 822.

I'd like to thank you for this. Without the English docs I was probably still
somewhere in the stone age struggling with Geneva or whatever other OS
Contrary to some people who had big difficulties to install KGMD on my
TT030 I didn't had any probs with it thanks to the kemdinst.txt.
I only wonder why I couldn't install KGMD on my Hades? I believe it had
something to do with the ramdisk.
A while ago Louis said something about this but I can't recall me what. Any
idea someone.

>So, of course they are different.
>If you need info, or kemdinst.txt being too complicated, you can always
>read the original kgmd install text.

If someone isn't able to install KGMD with kemdinst.txt he/she won't be
able to install it by reading the German txt either. IMHO, not very clear
at all.

Dongle port would be favourite, the interface becomes part of the circuit
board then....I'll look into it software will be pretty crude, an
auto-folder .prg to get it at boot up and a setter prg/ttp witha minimal
interface...I've never programmed anything before, this should be a
challenge...I guess it'll cost about 20 UKP though lookin at the price of
RTC chips...

1781. Re: IBM SCSI drive question, again

Newsgroup: comp.sys.atari.st
Date: 1999-01-28 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <36b0d14a75ceed0@holleman.demon.nl>
Source record: 85409

Part III

For the time being I gave up trying to format/partition this IBM drive,
simply because it won't go.
HD-driver no longer lists the drive in the format/partition menu,
ICD-Pro reports "drive/controller does not support SCSI Reassign Blocks
command, Fatal error", this appears after the sector test (real nice one,
after waiting for more than 1 hour on the results)
SCSI-tools reports "RAM-fehler beim formatieren, SCSI-fehler 64"

The only thing I can try is hook the drive into a PC/SCSI system and give
it a try from there.

Now, another question rises: can one use DOS-compatible partitions on an
Atari system? Any specific settings to be observed?

>
Boy oh boy, here we go again...

Of course all these troubles were my fault. No doubt about it. The server probably had seen it was ME, fetching all the archives, so it decided to send me a special version, therefore the Install package refused to work on my machine. I got stuck for 3-4 days, then Katherine finally helped me out, together with someone else. (Tks again, Kath!)

Next I did some clumsy things (no-one else ever will!) like putting in a 14-pt nonprop font into my N.AES (which is said to be capable of handling that, why otherwise would they implement the feature?) and found several apps going bezerk with that. Another OHTL (only happens to Lewey) feature. So does N.AES suck? Not to me, but others start deciding for me that it does. Well, you can't rule The World...

Meanwhile I am trying to work Mint/n.AES for a while to see what it's all about.

Rite, nice little note: after all the fiddling to get MintNet going (remember I asked about the on/off switch???????) I discovered that after one session to my ISP, I sometimes had trouble with the next one. Needed to fiddle around with Connexion before the modem would do what it's supposed to do: get a connection with my ISP. I was thinking of yet another OHTL feature, but surprise surprise, I read someone else has similar troubles and needs a system-reset to connect again...

Nah, that won't be an extra point for MagiC (which BTW reconnects 3.998,398,463,789,683 times without fiddling)...

Nope, this article will be that of an unprejudiced (can one ever be?) user and perhaps I will compare in the end, but mainly for my own preference.

And the winner will be:..... (c'mon ASH, I need the upgrade to v. 6.0!)

(Bbzzzzzztt: Woller & Link: I still have to b.. my own copy, can err we make err any errr deals errm perhaps?)

The Bottom Line (yes folks, there is one):

Don't label me, the same way you have labeled yourselves!!! (and think
about this one, please)

Hello Martin,
about 'Newsie 0.94' you wrote:

>I just don't know what a MIME message is
The Okami hypertext says this about MIME:
MIME, short for "Multipurpose Internet Mail Extensions", provides
an extensive standard for Internet messages. To name the most
important aspects: MIME formats are designed to allow for textual
header and message bodies in character sets other than US-ASCII,
an extensible set of different formats for non-textual message
bodies is provided, as well as a format for multipart message
bodies.

My main experience with MIME is that 2 of my brothers send me big email-messages, like 7 or 8 kB while a normal plain ASCI is only 1 or 2. They run PC's with Windoze stuff. Their messages consist of two parts (multipart, yes, there it is): first a ASCI version and then - in the second part - the same message with HTML codes. I can then save this second part separately as a HTML-file, load it in CAB and view the message with the titel in red letters, the sender in green letters, text in different fonts and more of those pretty and useless features :-/.

>and have no idea of what option to choose.
Nothing in the manual or readme files?
>Is this a stupid question?
It's no problem to me. Regards, Joost.

M> make sure that the dir you want to mount is readable for "Others".

Thanks for your attention Martin. Both are configured according to docs
and man. Flags are set, too. I made a mistake in my previous post, this
were version 0.50 & 0.54 i was talking about, not 0.70 & 0.74. Anyway,
i always get the same error:
do_nfs_mount: RPC call returned 3
mount_nfs: could not do NFS mount

M> There was a port of a newer version of NFSD and MOUNTD fron some
M> other Unix, but it hasn't worked for me.

Yep, i tried too, but worst results :-/ There is obviously a pb with my
system... I think it's a portmapper problem as it's killed at boot up
time as soon as nfsd or mountd are launched. Weird. Is there a more
recent version of portmap since the one relea
sed in the kgmd? Is there
any doc or man for portmap, i don't have any?
Bye bye Martin.

Not a very high value. A typo or what? With MiNTnet and the
cab-for-MiNT.ovl I get speeds up to 3500 cps (with a 33.6 modem).
aFTP is also flying. durin uploading to the Belgian ftp-site I usualy get
around the 3200 cps

One of the big possibility is that it only can be used with Magic. Not
totally true. I've it running under N.AES/MiNT, but with this setup you
can only use Cab, no Fiffi.

1796. Questions for Atari ST, Falcon, GEM (etc) users

Newsgroup: comp.sys.atari.st
Date: 1999-01-28 00:00:00 UTC
From: p_s_g@my-dejanews.com
Message-ID: <78p3atjgd1@nnrp1.dejanews.com>
Source record: 85454

Hi everyone,

I'm responsible for redesigning Ataricentral and eventually Atari.net and have recently had a very interesting email conversation with an ST user about the issues involved in the redesign of the site. There are a number of questions that came up which he suggested I post to this newsgroup, and which have a direct bearing on how user-friendly the site will be for seasoned users of the ST and other Atari computers. Please feel free to chime in on any one or all of these concerns. Your input will influence some important decisions I have to make.

First off... I'm curious as to how many of you were familiar with Ataricentral or Atari.net at all? Were you regular visitors, message posters?

Reason I ask, is the person I spoke with mentioned that the ST has trouble with Tables, yet the original Atari central used tables. For those of you who do surf using an ST or other Atari system, what was the general user experience at Atari Central? Bearable? Slow? Fine? How could it have been better?

Any other information you can provide which you feel is important to know in the design of a website which is friendly to the Atari system you use would be more than welcome. Feel free to send email directly if you wish to:

mailto:webmaster@multimedia1.com

Thanks very much for your time and any information you can send my way.

Paul Gutches

There was a review of Augur OCR in Issue 32 of Atari World (October 1988). Does anyone have any experience of it? It seemed to use an odd image format called *.SCN and had a plug-in for the cartridge port. Not sure if this was a dongle or the program on ROM.

It's ISP dependent. They may restrict connections to their web server to
people on their own network. Not all ISPs have this restriction, for
example if you set a separate homepages password Demon will allow uploads
to home pages from anywhere. Might be worth checking CiX's and Freeserve's
docs (probably not worth the mega bill ringing Freeserve's tech support!).

>
> AV-Protocol - ?

Used by some apps etc for communication between each other: it lets them do things like loading a second file into an already-running instance of a program if you double-click the file from the desktop, rather than the desktop trying to load another instance of the program. CAB uses it if available for calling helper apps. Needs an AV server of some description: usually a desktop such as Thing or Magxdesk. Thing is supposed to be the most complete AV server around. The name comes from the Gemini desktop where it first appeared, IIRC. I think the V stands for Venus, which is the desktop bit and A for something-that-escapes-me-at-the-moment, which was the shell (?).

> GEMDOS - ?

The bit of the operating system which deals with disc I/O.

> AES - Is this what we know as the GEM Desktop? Alternatives:
> gem.sys, geneva.prg, Xaes, N.AES, and Multitos (AES 4.0)

It's the GEM (graphical) part of the OS, so the desktop is part of it in some systems (not in others). It contains all the functions for drawing windows, menus etc. Strictly speaking the desktop is an app that uses the AES, but in some cases the two aren't separable.

> GEM.sys - another AES? Or is this MultiTos?

It's the AES bit of MultiTOS and AES 4.1. Possibly the same name is used by other AESs, such as N.AES (which is a development of MultiTOS, unless I've got the wrong end of the stick): I'm sure someone can confirm or not.

> Geneva.prg - another AES? Multitasking. Comercial?

Yup. Co-operative multitasking only, unless you have MiNT underneath it, and yes, it's commercial. It has no built-n desktop, but is usually bundled with Neodesk as they are by the same author.

> N.AES - a new AES replacement. Commercial GUI for MiNT.

Yup on all counts.

> XaAES - free GUI for MiNT. Is this an open source project? Not
> completed yet?

Yup. Possibly dying?

> OAesis - another AES, free, open source project.

Yup. Possibly dead.

> Cab - Crystal Atari Browswer. How would this run on a stock
> ST in low or med rez? Should it only work in high?

Works in low and med res, with predictable limitations. Dialog boxes are too big for low res screen in some cases. Med res looks as awful as it usually does! ST-hi res is preferable. Apart from memory limitations (which would restrict font handling etc), it runs fine on a stock ST, using STinG as a desk accessory under single TOS. Older versions are smaller, but less capable. It really starts to breathe in 4 megs with NVDI or GDOS for font handling, preferably on a big colour screen and with a multitasking OS.

> Stik - "ST Internet Kit" - a TCP/IP stack that handles only SLIP
> protocols. Few use it nowadays.

Yup, but not sure about how many use it. Generally STinG is better.

> Gluestik - A translation layer which lets you use STik/STinG
> clients with MiNTnet. It allows you to use STiK applications
> without STiK. Instead, you use MiNT+MiNTNet

Yup.

> STinG - TCP/IP stack
> that handles PPP or SLIP protocols, which
> uses STiK's data structure (what does that mean?)

Yup. It means that STiK clients see it as a different version of STiK and talk to it in the same way, hence no need for a translation layer such as GlueStiK.

> Draconis - another tcp/ip stack, not compatible with any other, has
> its own clients, a browser called The Light Of Adamas, email
> client called Marathon. Was going to be commercial bundled with
> the Milan.

Yup.

> I-connect -?

Yet another TCP/IP stack, not compatible with anything else, has its own clients, published by ASH. Bundled with the commercial versions of CAB, and has its own CAB.OVL. ASH Emailer does mail and news with it, and there is an FTP client (Fiffi) and telnet client (called telnet, with stunning originality!).

> MiNT - MiNT is Now Tos. multitasking Kernal to allow TOS programs to
> multitask. It can use external
> file systems. It doesn't completely replace TOS, does it?

Not at the moment.

> Someone said it replaces GEMDOS?

Pass.

> Does MiNT have a file system of it's own, or does
> it use the standard TOS file system unless it is given a XFS?

Both, in recent versions, I believe.

> Is this considered an "operating system"?

Good question. There was an argument in here recently about this.
Technically no, as it uses bits of TOS for interfacing some hardware, so
it's more of an OS extension. In practice TOS/MiNT in combination is an
operating system.

> FreeMiNT - MiNT officially continues development under this name for
> legal reasons of copyright.

Yup.

> MiNTNet - tcp/ip for MiNT.

Yup.

> MagiC - A TOS/GEM/AES replacement? Commercial. Can it use other XFS
> file systems?

On an Atari, MagiC is a full-blown OS, ie it doesn't use any of TOS once
it's loaded (it uses TOS as a loader at bootup). So yes, it replaces the
whole of TOS including the AES and GEM. On a Mac, it's also a replacement
OS, though it does run as a MacOS app, AFAIK. On a PC, it's a two-part
thing, an emulator and the OS itself, so it runs as a Windows app. It's
commercial and can use other file systems, but its XFSs are different to
the MiNT ones and not interchangeable.

> Minix - another Unix-like OS.

Yup.

> MiNT'98 - ?

Recent CD-ROM containing a MiNT distribution.

> KGMD - Knarf's German MiNT Distribution - Everything MiNT, in German.
> KEMD - The English docs for KGMD

Yup.

> Newsie - a Newgroup reader that handles email, FTP. I don't
> understand why or how a newsreader could use FTP. I thought that
> was the brower's function.

It has a very basic browser in it too. It's just several clients rolled
into one package.

> PPPkit - a cut-down MiNTnet stack to allow internet access using MiNT
> but without installing the Minix file system. A "Toy" version of
> MiNT Net. Needs modernization.

Yup.

> WWW(kit?) - I do remember seeing this long ago. A distribution
> initially
> contained STiK and CAB, and other STiK cliens, but got too big
> to include all-in-one.

Yup.

> MinixFS - Minix File System, with extended filenames, and can
> be used by MiNT.

Yup.

> MiNTXFS - MiNT's file system?

More a definition of the way different file systems plug into MiNT

> CDRomXFS - file system for CDroms.

Yup.

> Spin.XFS - another CD rom file system.

Yup.

> Thing - DEsktop replacement. Commercial?

Yup. Shareware. Customised versions come with N.AES (N.Thing) and the Milan
MultiOS (Ming), which are commercial.

> Newswatch - a news client for STiK/STinG which uploads/downloads in
> various formats for use
> with a range of offline readers such as Oasis, Snews, and Okami.
> Not a newsreader in itself. [I don't understand why the offline
> readers can't retreive their own messages]

Yup. The separation of news/mail fetching and the offline reading software
is largely historical I guess. However, there are advantages with a program
such as Okami, as it can be used with a variety of transport methods, to
suit the user.

Both Snews and Oasis were written specifically as partners for the NOS
program which never had a built-in news or mail reader, just did all the
online stuff (such as mail and news fetching, telnet, ftp) in one package.
Snews/simple mailer was generally bundled with NOS, though.

When most people shifted to STiK/STinG, NEWswatch and POPwatch became
necessary as STiK and STinG are purely TCP/IP stacks with no mail or news
capability built in.

> Popwatch - Comanion program to NEWSwatch used to upload/download email
> via STiK/STinG, uses the POP3 server, not the SMTP server. Not

> for reading, editing, or replying to email. What is the
> difference between the POP3 server and the SMTP server? As in
> Newswatch, why can't the email client/program get its own mail?

Yup. POP3 and SMTP are just different ways of dealing with mail transport.
All sending is SMTP. POP3 is for receive only, and designed for dial-up
type accounts. SMTP is more suitable for servers, but some providers offer
both. Main difference in practical terms is that an SMTP server can
initiate the connection when you log in to the net, whereas with POP3 *you*
have to connect and request mail.

> PopGem - same as Popwatch, some say for MiNTnet, others say no, not a
> MiNTnet client only.

Yup.

> Nemesis - A hardware mod overclocker for the Falcon.

Yup.

> NOSTalgia - ST emulator for the Mac.

Yup.

> FAT32 -

FAT variant using 32-bit addressing, smaller sector size so more efficient
use of disk space at the expense of a little speed. Originated in Win 95
OSR2, standard in Win98, now available on Ataris via MiNT.

> VFAT - alternate file system as used by MagiC and Windows95. Long
> filenames, case sensitive, that can be used on TOS partitions,
> similar to the way
> DOS can read Windows 95 directories.

More of a file system add-on, I guess. Can be used on DOS FAT16
partitions/floppies, FAT32 and Atari TOS partitions/floppies.

> WenSuite -?

Yet another net suite with its own TCP/IP stack and set of clients. Not
very reliable, by all accounts. Commercial software by OXO in France.

> Infiltra - email client for STiK/STinG.

Yup.

> aFTP - STiK application for FTP.

MiNTnet version available, indeed the MiNTnet version is the primary one.

> DuFTP - a GUI interface to the MiNT version of FTP.

Nope. A MiNTnet FTP client in its own right, not a shell for anything
else.

> Fiffi - Ash's FTP client

Yup. For I-connect only.

> Miscellaneous questons:
>
> 1) Why would a Minix file system be required to run MiNTnet?

It's not. But many MiNTnet *clients* are ported Unix stuff and need a
Unix-like system to work, including a suitable file system.

> 2) of AES, why can't one have a multitasking AES without
> a multitasking TOS (MiNT)?

You can, eg Geneva. However, the multitasking isn't as good and most AES's
are designed to work with an underlying multitasking OS anyway.

> 3) The regular TOS file system can't be upgraded to use VFAT,
> right?

Wrong. VFAT can be applied to any TOS partition/disc. TOS won't use the
long filenames, though.

> 4) I'm still not clear on the difference between PopWatch and
> PopGem.

They are two different programs by two different authors.

This new version of Newsie seems to have got rid of one of my bugbears - a display of a box giving an AES call number (usually 104 or 105?) after, for instance, a mailbox was closed.

I'm learning to find my way in the vast realms of the net.
This is the fifth day of the second part of my life with computers.
I was looking in the atari stuff, I didnt realize that zlib was unix.

By the way, is there a general strategy to find out if what you find
is out of date. Of course an old date is a indication, but is there something
I missed. Or do you I have to look at them all. :-\

Hi people.
I prepared 2 archives to share with you guys.
Now it's on my page, (kellis.atari.org)

1st archive: 85 img files, 16 colors ST palette of all the best
backgrounds for your desktop. (~800k zip)

2nd archive: 17 of them, but 256 colors. (best if used in TC mode, because
of the palette changes) (~700k zip)

enjoy.

In a former life as an exotic dancer, Nicholas Bales
<bales@directprovider.REMOVETHECAPITALS.net> wrote:
> Maybe someone should take up development of ST-Zip to include long filename
support. Zip on the PC definitely does and I find zipfiles are more convenient
because it's available on most platforms. This makes it easy for people to
download from the net and zip to a floppy to port it directly over to an Atari.
>

A while ago we (KPP) were looking into the possibility of writing a MiNT
.xfs (loadable filesystem) to handle ZIP files. This would have been similar
to ZIP Magic on the PC (though we predated that ;) and would have essentially
turned the reading and writing of ZIP files into an OS function - with the
result that you could read or write individual files in a ZIP vie the
fileselector.

Unfortunately we didn't get too far before we were forced to move apart and
KPP stagnated, but it might be an interesting approach to take if someone
wanted to write a new ZIP application for the Atari.

1809. Confused by umlautes again

Newsgroup: comp.sys.atari.st
Date: 1999-01-28 00:00:00 UTC
From: gokmase@hem1.NOT.THEESE.passagen.se
Message-ID: <78p41b$rv3$1@cubacola.tninet.se>
Source record: 85467

Greetings Atarians!

I have (as I told you recently) added support for ISO-8859 character set and this is now working very well. BUT, when I load a truetype font and begin to write, none of the umlauts looks like it should.

An example:

I wrote a document in Word (PC) and used the truetype font Arial. Later I loaded it inside a text-editor on my Atari. When I use the ISO-8859 font this looks exactly like it should, but when I select the Arial font, the umlauts freak out again.

I had expected that the text (typed on PC) and the font (taken from a PC) would look quite the same. What is going on? Is this something to do with NVDI? Is it performing some internal remapping of characters to match the original atari character table? If so, could this be changed to match the ISO-8859 norm?

Please explain this to me, cause I'm getting slightly confused to say the least. -Help!

Regards,

Joakim

You don't state whether you're trying to access the page via NEWSie's
browsing feature or with CAB. If the latter, and you have NEWSie entered as
a client for FTP, try deleting the entry. CAB will then take on the duties
and you should find that this works OK.

>like that....
>
Hi Chris,

well, I'm not giving up (yet)... gonna try again hooking it up to a PC
with SCSI, see if I can get to it right or not.
Bloody shame, got this 2 Gig drive and I desperately need diskspace and it
won't run here.
At one point I think IBM does a great job putting all this info about
their drives on the web, at another one it seems sometimes the info is not
complete, and also every drive has different stuff going.

The strangest part is that yesterday, once properly configured I could get
to format/partitioning with HD-driver, and no longer after the sector test.
SCSI-tools and ICD-pro both won't complete the job either.

>This could offer an alternative to actually getting a CDR.
>Just an idea,
>Mark

If the Falcon can already record to CD then why bother messing about going
Via a Minidisc unit?. Are you sure that your not confused about what
Minidisc is?.
They are not miniture CD's, well pre recorded ones are as they are optical
apart from the fact the Minidisc has half number of bits (8 as opposed to 16
for CD or 24 for DVD audio) but recordable one's act more like mini floppy
discs as the laser used for reading prerecorded discs (CD style) is use to
heat up the recordable disc, the data is then written to it magnetically and
fixed when the disc cools down, this prevents damage to the recording from
exposure to magnetic field as unlike tape the magneic material in the disk
can only be altered when it is heated up. On playback the disc is read
magnetical like a floppy.

The answer is not that clear. Actually the authors released the STOS
interpreter and compiler source code, which makes it legal to get the
source and compile it. I'm not sure that means that you can freely
distribute a precompiled version. I suppose you can always ask the
authors:

Look for at least a 1040STFM with at least TOS version 1.4 (also
called 1.04) A memory expansion of 4MB and a hardddisk could be
welcome.
More powerful models are the TT, the STe, the Falcon. But I'm living
with 1040STFM and am quite happy with it.

A shame really as it can mean a superfluous phone call.

>to home pages from anywhere. Might be worth checking CiX's and Freeserve's
>docs (probably not worth the mega bill ringing Freeserve's tech support!).

Absolutely not - it's barely worth browsing the customer services bit
either, but it might be the only way to pick out the names of the proxy
servers from amongst the otherwise Windows orientated stuff.

1825. IConf question

Newsgroup: comp.sys.atari.st
Date: 1999-01-28 00:00:00 UTC
From: derryck@TAKE.THIS.OUTcix.co.uk
Message-ID: <78pp03$98g$3@news5.svr.pol.co.uk>
Source record: 85483

Is there an official line on whether one is to enter the dotted quad version of one's ISP proxy servers in the menu item "Services" as the manual states - or is one to enter the name (as in smtp.freeserve.net)? IConnect doesn't seem to care either way, and the input lines do not contain the correct mask to ensure that only numbers can be entered.

Also in the same menu there is a line preceeded by a stamp symbol, I'm assuming that this is to hold one's username - but there is already an entry for this elsewhere (in the "Account" section?).

Yours,

Confused of Watford

since Milans are built in PC Tower cases, which usually have power supplies switchable between 120V and 220V, that part shouldn't be a problem.

and more important b) with their fairly limited
> production can't afford to get FCC approval (or the machine may not
> pass it in its present state, for all I know).

that makes more sense, especially in light of the problems Atari themselves said they had getting FCC approval for a number of their computers.

What's your configuration ?

Are you sure that you start the kgmdinst.tos you have NOTHING in memory ?
You simply boot with the CONTROL key pressed, no accessories, no AUTO program, etc.

Quick question: With TOS 1.62, when a TOS program is executed under GEM, does GEM get removed from memory whilst that program is running, or does it still hog 256K or whatever it is?

Thanks in advance,

Trystan

GEM does not hog that much memory, on a normal ST it can't be more
than 60-65Kb (screen-buffer, menu/alert/dialog-buffer ++). It's not
"unloaded" when you run a TOS/TTP-program.

Derryck asked;

>Is there an official line on whether one is to enter the dotted quad version
>of one's ISP proxy servers in the menu item "Services" as the manual states
>- or is one to enter the name (as in smtp.freeserve.net)? IConnect doesn't
>seem to care either way, and the input lines do not contain the correct mask
>to ensure that only numbers can be entered.

In the menu "Services" You have to enter the name of Your ISP mail and news
servers (fe. relay.ping.be & news.ping.be)

In the menu item "IP" you may enter the ISP DNS1 server, although I
haven't noticed much difference between entering it or leaving it blank -)

In the menu item "Services" the rubber stamp and key symbols entries are used to
access Your mailbox, if You leave those blank, ASH Emailer will not be able to
connect to your mailserver.

In the "Access" menu item the password and username are used to make the connection
to your ISP. NOT to the clients (email, newsgroups, telnet etc..)

In the menu item "Proxies" you may enter the proxies of your ISP, experimentation
should be done here, sometimes its faster without the proxy.....
If You do use a proxy, don't forget to enter something like *.ping.be in the menu
item "don't use for".

Switch on the "Pro" box and experiment with the maximum transmission unit in the
"IP" menu item. Standard it is set to 564 but this value may be different according
to the ISP you use. I get the best values when set to 1650....

In the menu item "IP" raise the cache to 512Kb

Also "play" with the other values, raising or lowering them a bit can really make
a big difference.

When IConnect is "tuned", it leaves STING far behind, running CAB under IConnect
gives me speeds up to 1000cps more. You will notice also a difference in speed when
sending and receiving mail and newgroups under ASH Emailer. Oh yes, and FIFI will
fly !!!

The annoying "waiting for connection" doesn't appear anymore, and when downloading a
file from the web it comes in one nice "stream". No more stops of a second or more
before continueing.

I think IConnect has got much more power and possibilities, but because of the
CAB.OVL and the "lousy" documentation it has got a reputation witch it doesn't
deserve.....

Cheers from Belgium

This is a 4Mb Falcon030 on a clean boot with nothing but AHDI. The exact
message I get is "can't change to directory 819231" or some other number.
After hacking the mint.cnf it looks like for some reason the "tar.ttp -C
/ram -xzf minimint.tgz" fails to uncompress to the ramdisk. Without the "-C
/ram" option the .tgz uncompresses fine.

No, you'll have to build it yourself. There are instrucitons in the Quick
FAQ somewhere or at least pinouts.

>My second Atari monochrome is slowly dying.

It can probably be repaired by a TV repair place, as long as you provide
them with the ST so that they have a signal to work from.

I was a regular on the message board, but I didn't see many more people from here. It didn't seem to be the same kind of population. Mostly either net.newbies who didn't know how to use usenet, or old Toad customers. Not really the kind of die-hard Atari freaks you find on here.

>Reason I ask, is the person I spoke with mentioned that the ST has trouble
>with Tables, yet the original Atari central used tables. For those of you
>who do surf using an ST or other Atari system, what was the general user
>experience at Atari Central? Bearable? Slow? Fine? How could it have been
>better?
>

The wwwboard page was waaaaay too large, since the messages want back to 1995. Tables are ok, but take some time to calculate. What some browsers have trouble with is frames. Please, don't use frames. Even Netscape 2.0, which introduced the frame concept, had trouble with dealing with them. I hate frames.

Other than that, avoid huge imagemaps. If you have to use imagemaps, always put some text links somewhere underneath so that text-only users can still go through the site. And use the Alt="" option for images too.

Get an STE, either 520 or 1040 doesn't matter, since you'll upgrade it to 4Mb as soon as you get it. The STE has better sound and a blitter chip and several other things.

Or better yet, get a Falcon, a TT or a Milan!

You can read/write DOS compatible partitions with HDDRIVER and MagiC,
FreeMiNT or Big-DOS. With HDDRIVER you can also partition a drive so
that it is both DOS and TOS compatible at the same time. In this case
except for HDDRIVER no additional software is required.

There is nothing unusual with drives being hard sectored and having 512
bytes per sector. This applies to most drives.

Hi Uwe,

there still remains some question: the first time I got this drive running OK (meaning I got the jumpers set right, so the drive started spinning up after the HD driver was activated, next I could hear the heads move into position and it got ready) I started HDUtils and went to the format/partition menu. Drive was listed here and when I selected it the info I got was it had one DOS partition of around 1000 Mb. Since the drive is a 2-gigger, I wanted to repartition into 4 partitions and make them TOS-compatible. After I clicked OK I recall I got a message like "unable to write data to disk". Next I tried to format the drive, so I selected it again for formatting, leaving it on 512 per sector and selecting the TOS option. This looked like going well, then the sector test ran for more than one hour, displaying around 50 bad sectors all in the end. Next came an alert box with a question which I answered with "OK", then again came some message "can't write to disk" or something like that and that was it. I went back to the menu item and from then on the drive wasn't listed no longer. How's that possible? It still shows up in the ID-check etc, but after the first sector test with HDDriver it's no longer selectable for formating/partitioning.

I can select this drive still when using SCSItools or ICD-Pro, but all formating/partitioning ends up in the messages I mentioned before.

1842. Help coding ethernet driver

Newsgroup: comp.sys.atari.st
Date: 1999-01-29 00:00:00 UTC
From: lvzon@bio.vu.nl
Message-ID: <78sa1v$942$1@feresa.bio.vu.nl>
Source record: 85300
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech,comp.sys.atari.st

OK, I know that it's nearly a death sin to ask this, and I normally
wouldn't even think about doing so, but... I need someone to help me
to trace down a nasty bug.
Now before people start flaming me, let me explain myself, as this may
be of some interest to others as well...

A few months ago I started looking for a cheap method to connect my
Falcon to an ethernet. After considering various types of adapter I
concluded that the best thing would be for me to buy a little device
based on the RealTek RTL8012 chipset. Now this little fella' is a
parallel port ethernet adapter, a bit like the good old DE-600, only
with much better specs and easier to get. I picked one up second-hand for
less than 30 euro, downloaded the data sheet and PC-Linux driver code,
hooked the thing up to the parallel and EJP ports and started coding...
A Belgian fellow called Karl Samyn, who was so kind to aid me in the process
of choosing the best ethernet solution, attended me to the fact that two
French guys, Eric Gaudet and Rodolphe Pineau, were also working on a driver
for the RTL8012. I contacted them, and they were so kind to send me the
code they had so far. Unfortunaly it was all in assembly, pretty hard to
read and not very suitable for what I had in mind (MiNTNet).
Plus I didn't have a macro assembler and proper debugger to test it,
and I didn't want to wait months for them to finish it, as I'm in a bit
of a hurry to get this thing up and working...

The next three months or so were spent debugging a few kb of my own code.
I am now able to access the control registers and read out the
packet buffer using various transfer modes. Once. After that the
device locks up and I have to reset all power lines, including my Falcon.
And _that's_ the problem: I'm stuck.
I've been stuck before, of course, but this one bug is starting to drive
me insane, up to the point of thinking about giving up.
I've spent the last month going over and over my code, other people's
code and the data sheets, found and fixed loads of bugs,
took lots of breaks to calm down and think and even managed to get some
work done for university, but it _still_ doesn't work! Aaarrrgghh!

The previous two times I got stuck it turned out to be some
really silly bug which I just didn't notice for a week or so,
and I wouldn't be surprised if it were something like that again.
On the other hand, I could well be doing something basically wrong
on the software or hardware (difficult to trace, I only have an ancient
multimeter which is very unreliable) level, as I'm not an expert on these
things.
It would *really* help if someone with a fresh perspective on things

were to take a look at the code (GCC C and assembly) and the hardware
design. Even a hint at what the problem could be would be superb.
I tried contacting the two French dudes, but they haven't replied.
So that's why I'm trying this slightly more radical approach.
If there's anyone who'd like to help out on this, please reply by
email and I will mail you the details (my notes, the code and the
data sheets) or put them up on my website. And remember, it's for
a good cause: a cheap ethernet solution for Falcons (and in the future,
STE and others as well)!

Thanks,

Hi John,

Aha!, someone else jumps into the fray! Well I guess I must have a magic ftp program, because I can get thru, but you and two other people can't. Hmmm, I don't know what to make of that. Maybe it's ISP related. I just tried the site now (about 4:30am Seattle time), and I got thru. I HAVE had problems with that site in the past, however. It could be related to the time of day in the UK. I'm using Newsie 0.94 - (yahoo for Rojewskie!), Stik, Falcon, TOS 4.04, Nemesis. If anyone else has any input in this, I'd be curious.

And Sean, if you can't get thru, I'll email you the program file you need.

Bye,

Clayton Murray

1845. Help installing Applications in MagiC

Newsgroup: comp.sys.atari.st
Date: 1999-01-29 00:00:00 UTC
From: jperez@Hawaii.Edu
Message-ID: <78sd36$adb@news.Hawaii.Edu>
Source record: 85303

Greetings,

I just received MagiC 6 from Chromagic software, and am in the process of trying to get my system switched over to make the most of it. The problem that I'm running into (in Magxdesk) is that I can't seem to assign icons or install applications properly. If I select an application and then "assign icon" or "install application", I get a box with several options (such as limit memory, run in single mode, etc..) but the icon that I choose doesn't get assigned to the application, and I can't find anywhere to put file extensions to associate with the application (such as ZIP, LZH, ARC, etc... for my archiver program).

The manual is vague, and doesn't include a lot of information that would allow some of the real power of this operating system to become clear. If anyone can offer some assistance and/or send me some electronic documentation that may be of use, I would greatly appreciate it.

Cheers!

HI Tom!
I can sell to you both Geneva and Neodesk (latest versions)
What's your offer if interested, I'm not in Canada nor the USA, but what the heck.. I'm in Iceland.
Regards,
Torfi

1847. Help installing Applications in MagiC

Newsgroup: comp.sys.atari.st
Date: 1999-01-29 00:00:00 UTC
From: torfi@veda.is
Message-ID: <zWis2.16619$h5.124487945@WReNphoon1>
Source record: 85305

HI!
First select the program Icon, then go to Install Application. Then you get
the dialog where you can decide whether this is a multi or single tasking
app. Choose the install application button and you will get a second dialog.
Make sure that the app's icon is selected in the right part of the dialog,
choose new or add in the left part of the dialog and up pops a dialog where
you put the endings of the files that are associated with that prg; *.IMG
etc..
My MagiC is in german so your dialogs may use different words.
I hope this helps
Torfi

Hello. Is there an Atari ST FAQ? I am wanting to find a lot of general "newbie" infromation on them.

Thank you,
Jason Whorton

Same for me, I mailed the progs to him too and no answer !?
Anyway, still am happy to see some Logic folks still exist and
try to help themselves !

>they truncated?
>

My suspicion is the problem is with folder names only. But as I noted,
I have not checked it thoroughly. I came to this suspicion due to the
fact that the original HTML file was a long filename, as so was the
graphics folder and the graphics filenames. CAB would display the HTML
file but none of the graphics.

By truncated file names, I'm referring to MS's way of handling long
file name in older machines, where dummynumber1.xxx and
dummynumber2.xxx become dummyn~1.xxx and dummyn~2.xxx when displayed
under plaing old DOS or Windows 3.x and older versions.

I'm going to check out W3C.com and see if there are any "official"
recommendations or standards in this area. But I plan on sticking to
the 8 & 3 convention, because it just occurred to me there may be other
lesser known graphical browers, and possibly text browsers, that can't
deal with it. And I'd rather have those folks saying nice things about
me rather than bad things because they can't access it.

>And you sure it wasn't a problem with case and not file/folder name
>length? You will most definitely have problems if the file doesn't
>match the case EXACTLY as it is in the HTML.

No, I'm not. But I didn't manually create the HTML file. It was done
with Claris Home Page 2, and I am assuming it does not have a bug in
this area. It does have a bug when it comes to images and inserting

them, forcing a quit and restart. It's an irritant, not a major problem.

I've printed your post, and will try to check out the case sensitivity issue the next time I work on the page.

If you want to take look for fun and curiosity, send me a note via email at Wordworks@Greeleynet.com. This net address is going away. Eventually I plan on submitting it to the search engines, but I'm not ready for that either.

FWIW, I'm still Frozen.North@Genie.com, too. <G>

OK, so if RealAudio format isn't a good option for on-demand voice webcasting to a stock ST, what other choices/formats would be available? Is there a decent MP3 player available? Any other choices? I have an audio webcasting project that I am working on for PC's, and I need to know if it is possible to make it available for use on ST's as well.

Oboy!

After digging myself into more tech info on this IBM drive, it appears to be a *differential* SCSI-2 type...

Found some info somewhere that said the 50-pin connections on a differential SCSI device are totally different from those on a single-end SCSI device.

This could explain all the troubles. Plus it adds new questions:

- can differential SCSI devices be used on the TT's SCSI bus (it appears there are converters for diff. SCSI)
- can differential SCSI devices be used combined with single-end SCSI devices on the bus?

One for the real SCSI-wizards, I think :-)

Unca Lewey wrote:

L > I gave up trying to format/partition this IBM drive

Have you tried Diamond Edge? I don't remember exactly how I did it,
but whenever I have a drive around here that 'won't' format,
eventually I throw DE ('Partition Hard Disk') at it, with pretty
good success (although I do get to see the 'Unable to complete
operation' error message).

btw, I am now manually entering the 'Ref' line(s) on all my
responses. Does it help? If so, I'll keep doing it; if not, well,
it's kind of a bother, don't you know.
